Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

NEVER despair, says Prentice. If the stream of your life freezes over, put on skates.

NEW PROCESS.—A Mr. J. A. Hutchings has invented a process for working ores in Colorado Territory. The following, referring to the working of argentiferous galenn, we publish, as perhaps some of our readers owning mines of that class may desire to experiment upon it:

There is a class of ore known as agentiferous galena, which, in addition, contain yellow pyrites of sulphates of gold. These are the richest ores in Colorado, continuing often from five to ten dollars per pound in gold and silver, and a quantity of lead, which has hitherto prevented the collection of the more valnable metals; in most cases, however, they will yield to the treatment last described: if not, they can be readily fluxed by the following receipt, at an expence of a few cents per pound, which is not much when the yield produced thereby is often as many dollars:

Intimately mix with the pulverized ores one-tenth to one-twentieth, by weight, each, of bicarbonate or nitrate of soda and rosin; place the compound in a cone-shaped boiler-iron crucible, and when brought up to a white heat, pour into a cavity in the middle of the mass similar and equal quantities, by weight, of pulverized borax and sulphur and double of alum, which will produce an immediate flux, precipitating the contained metals in a button of more or less purity; the whole time required being governed by the quantity operated on, and the amount of lead in the ores treated. If these melted ores are drawn off into cold water by tapping the crucible, the metals (if sufficiently hot,) will part or separate by explosion, the lead from the gold and silver combined, and the copper depositing in a thin coating from the water, as by electricity, on the iron or copper bottom of the vessel—the perfection of the process depending upon the degree of heat and quantity of lead in the melted ores, a white heat and considerable per centage of lead being necessary to the perfection of the process.

Mixed metals in amalgam can be separated by placing the amalgam in a flat sheet-iron pan over a brisk fire, when, in the process of retorting they will separate by explosion. Of course the pan must be covered close or they will bound out.

NOTE.—These processes are poisonous to such a degree that they should be conducted under a dome and pipe with a strong draft, or the operator may pay for the experiments with ruined health or his life.

A CURIOUS DISCOVERY—IMPORTANT, PERHAPS.—A London correspondent of the Liverpool *Albion* relates a curious discovery, which was recently brought to public notice by the Polytechnic Institute of that city. Professor Pepper, of London, prophesies that medical results of the highest importance will follow from it. But however this may be, there can be no doubt that it will receive the attention of the faculty of medicine and become the subject of experiment in our hospitals and infirmaries. It occurred to a scientific gentleman to examine, with a microscope, the impressions left on a piece of glass by the breathing of a number of persons; he found that different figures or impressions were made by different breaths. He repeated the experiment, and with similar results. This induced him to make drawings of the impressions, which drawings he submitted to Professor Pepper; and the Professor, ever enthusiastic in the course of scientific discovery, has had the drawings copied on glass, and now exhibits them through the medium of the magic lantern, to the crowds who visit the Polytechnic. I have seen them, and I can assure your readers that they are extremely interesting in a physiological point of view, and very curious even as a matter of cursory observation. One of them presents the appearance of a new in a kaleidoscope. On the magnified appears unparalleled to the spectators there presented to the combination most infinite variety of shapes and assembling stalactite like daggers, others resembling trees in flower-like forms, etc. These represent the breathings of different individuals. Professor Pepper is of the opinion that in cases of consumption and other pulmonary phthisic (consumption) and the character of complaints, observation on the breath is deposited on a glass in which the breath emission from the lungs other surface, after patient! Certainly, it would will be most valuable. every that a diagnosis extraordinary discovery might be given from state of one's lungs tion of the particles microscopical observation of the breath, as deposited assumed by the emission from the mouth sheet of glass, on

---

THE LATEST STRIKE.—Gold mined to keep the lead alley is determined. The *Union* gives the following matters. soberness and earnest: apparent

ROSIN.—Mr. Weed yesterday on his ranch on Slate Creek, a lead more or less than a big ledge nothing rosin" about ten feet wide. trifled

MORE EMIGRATION.—Every indication points to the belief that there will soon be a very heavy emigration to the Pacific slope in the Spring. Thousands of Missourians, who have been nearly ruined by the war—whose homes have been desolated and prospects blasted by the war—are preparing to leave the State. A majority of them are secessionists, who have lost faith in the fortune of the Southern Confederacy ever being able to reclaim Missouri; but there are likewise hundreds, and perhaps thousands, of good Union men, who have been burned out by guerrillas, and are now getting ready to seek there fortunes elsewhere. Many Western papers contain advertisements of parties who wish to form emigrant association to cross the plains, and advertisements of mules and oxen, suitable for a trip to California, are quite common. Many Illinois county journals contain advertisments of individuals having stores to sell out, "owner going to California," and at no time has the superior climate of California been more generally appreciated; but above all this, the hard money the gold and silver basis of business—has an irresistible attraction, for no matter how loudly men rave about the goodness of greenbacks, there is not one in a thousand who does not honestly prefer gold and silver if he can get it. —*Gold Hill News.*

TORTOISE SHELL.—What is called the tortoise shell is not, as is generally supposed, the bony covering or the shield of the turtle, but only the scales which cover it. These are thirteen in number—nine of them flat and four a little curved. Of the flat ones, five are large, being sometimes a foot long and seven inches broad, semi-transpareat, elegantly variegated with white, red, yellow, and dark brown clouds, that are fully brought out when the shell is prepared and polished. The laminæ, as we have said, constitute the external coating of the solid or bony part of the shell, and a large turtle affords about eight pounds of them. the plates varying from an eighth to a quarter of an inch in thickness. The fishers do not kill the turtles. Did they do so, they would in a few years exterminate them. When a turtle is caught, they fasten him and cover him with dry leaves or grass, to which they set fire.—The heat causes the plates to separate at their joints; a large knife is then carefully inserted horizontally beneath them, and the laminæ lifted from the back, care being taken not to injure the shell by too much heat, nor force it off until the heat has fully prepared it for separation. Many turtles die under this cruel operation; but instances are numerous in which they have been caught a second time with the outer coating reproduced; but in these cases, instead of thirteen pieces, it is a single piece.

GIGANTIC OIL ENTERPRISE.—The Pittsburg *Chronicle* says:—A gigantic enterprise is now on foot at Titusville, and one which settles many questions now in dispute in regard to the oil theory. A company of reliable capitalists has been organized for the sinking of a shaft at some point not yet determined upon, for the full and complete development of the geological peculiarities and facts of the oil stratification. The capacity of the proposed shaft is to be seven by fifteen feet, and it is supposed that the drippings of the rock, as the shaft progresses, will nearly, if not quite fully, compensate for the labor of this great undertaking. This undertaking will involve a greater degree of mining skill than any now practiced, as appliances will have to be made use of to keep the work free from petroleum gas, which do not come within the range of the ordinary class of ventilation; and these appliances are to be so complete and effectual in their operation, that no ordinary skill can invent them. Of course, after the shaft has reached a proper depth, to fully carry out the plan it will be necessary to run leads and drifts at angles from the main stem, which will eventually create courses or successions of caverns, which will become receptacles of oil, to be raised to the surface either by means of pumps or by hydraulic pressure.

SWEET POTATO PUDDING.—Half a pound of butter, half a pound of sugar, five eggs, one table-spoonful of brandy, two table-spoonfuls of wine, half a tea-spoonful of cinnamon, the grating of one small nutmeg, a pound of potato mashed fine, with a very little salt, and sufficient milk to make it moist. Beat the butter and sugar until light; to which add the potato, half at a time. Whisk the eggs until thick, and stir in gradually. Then add the wine, brandy, and spice. Mix all well together, and set for a short time in a cool place. This quantity is sufficient for three or four puddings, soup-plate size. Line your plates with a rich paste, observing to roll it much thinner in the center than at the edge. Bake in rather a quick oven.

A wealthy gentleman of Boston, at his own expense, has caused an artist to make a statue of Alexander Hamilton, which he proposes to have cut in Chelmsford granite and presented to the city of Boston.

DEATH IN THE WALL.—A good clean paper is certainly more pleasant to the eye than a fissured and smutty wall, whose scales of lime are continually peeling off and soiling every garment which comes in contact with it. And of a proper selection of paper is made, and there be no other lining of similar stuff beneath, it is not only more pleasant to the sense, but is almost equal to the whitened wall. But here is the difficulty. As a general rule, one coat of paper is put on over another, as the last gets too much soiled to look well, until several layers cover the original surface, thus often producing an actual cause of disease. A few years since we occupied a house built some twenty years before, in the old English style, strong and solid, so that it seemed almost as good as, or better even, than new. We were gravely told that one room in it had seemed to be fatal to its occupants, hence, for several years, it had stood vacant. One of the first things which received attention was this ill-reputed apartment. It was a north room, so situated that a few slanting rays of sunlight peered into a corner of it for a short time only a portion of the year, entirely avoiding it for months together. Well, here surely was one cause of its unhealthiness, but not enough. After the cobwebs were duly brushed out we searched further. A good sized fireplace and two large windows afforded entirely sufficient chance for ventilation, so we could not look here for the evil. The walls next received attention. They were covered with a heavy velvety green paper, but not only this, for upon peeling off a small section with a knife, another green layer was beneath it, and beneath this another, and yet another.—The mystery was solved. The cause of the evil was evident. Nothing would have induced us to sleep in that apartment. None could tell how much of the elements of disease that thickly papered wall had retained. None knew how much death there was in the wall! It seemed as if it gave out a positively sickening odor, now, and its entire removal speedily followed. Thereafter, though not so desirable as some others, it ceased to have any hidden dangers or terrors, lurking to poision the fountain of life. It is a safe rule to choose patterns of wall paper without green colors, especially those heavy greens which so please the eye, for they contain an active poison, inimical to life, and it is always highly improper to place one layer of paper over another. Better submit to the dirt and annoyence of having the last soiled paper entirely removed, than expose yourselves to the chances of disease and death through its retention.—*People's Journal of Health.*

ONE OF THE WONDERS OF THE LAND.—A writer for a Boston paper, who has visited the great falls on the Snake river, the southern fork of the Oregon, says; "The distance the whole volume of water falls in one sheet is 200 feet. Above there is about 25 to 30 feet fall before it reaches the grand fall. The width of the grand fall I should judge to be about 2,500 feet. I have visited Niagara many times, but this fall eclipses it far. Four miles further above we found another one of of less note, where the water divides into two parts, and falls a distance of 167 feet." When the Pacific railroad is completed, this will become a fashionable visiting place, as Niagara is now, with, however, a wider range of curiosities to attract the attention of visitors.

REMOVING THE MACHINERY.—The Virginia *Union*, of the 31st ultimo, says the Best & Belcher Company have been engaged the last few days in removing the machinery, etc., from their claim, with the intention of abandoning work for a while. The Company have expended over $100,000 in opening and prospecting their claim, which is situated on the Comstock, adjoining the Gould & Curry on the north, but although a vast amount of work has been performed, they have thus far failed to find it a paying mine. Their shaft was at one time deeper than that of the Gold & Curry, and served to drain that mine for a long period, until the shaft of that company was below the level of the Best & Belcher.

CHEATING THE REVENUE.—A very smart trick has been detected on the Canadian borders, by which the revenue of the United States was defranded. An individual has built his house directly on the line, so that the north door is within Canadian territory, and the south door in that of the United States. British dutyable goods pass freely into the north door, and are slipped out the south door for use in the United States. This smart dodge is to be stopped by an act of Congress, by which the fact of building upon the boundary line will, of itself, be assumed as evidence of a purpose to smuggle, and the revenue officers will be empowered to enter and search the premises and seize the goods.

THE NEWTON MINE.—The Amador *Ledger* is informed on good authority, that C. T. Meader' of Stockton has purchased seven-eighths of the Newton Copper mine, in Amador county.

TO MINERS AND MECHANICS.

The publishers of this paper are making great efforts to establish, for the benefit of miners and mechanics, a journal which shall occupy on the Pacific coast a similar position to that filled by the *Scientific American* and the *American Artisan* in the Atlantic States. Our isolated position and peculiar necessities appear to require a journal quite distinct, in many particulars, from similar publications at the East. To meet this want we have established the MINING AND SCIENTIFIC PRESS. Here the miner, the mechanic, and the man of science, find themselves brought in closer contact and more dependant, each upon the other, than in any other locality on the globe. Hence we have endeavored to present this paper to this community of interest as a representative journal. In order to carry out the plan of our work as it should be done, we greatly need the assistance and co-operation of those for whose benefit it has been established. Every miner, every mechanic and many men of science to whose attention this paper is submitted, or who may, as a regular subscriber or by casual circumstance, hold this paper in his hand, should show it to his friends—the miner to his fellow-miners and the mechanic to his fellow-mechanics—and do what he can to induce them to join him in the support of a journal whose measure of usefulness will be in proportion to the liberality with which it is supported. The press, throughout the State, and the public everywhere, so far as we are informed, recognizes the value and importance of the MINING AND SCIENTIFIC PRESS to the great interests in California, to whose advancement it is pledged. It has now reached its tenth volume, and is established on a firm basis. Its publishers are desirous of still further improving its appearance and usefulness. Hence this appeal to its friends. The paper has just entered upon a new volume and the present affords a most favorable opportunity to commence your subscription. Numbers have already come in, since the commencement of the new volume, and we hope to add many more to our list ere we reach the close of another quarter. No better investment of money can possibly be made by the miner or the mechanic. The information contained in one volume of this paper is of many times more value than the cost of subscription—and worth far more than the information which the same amount of money will purchase in books.

SAN FRANCISCO

CORDAGE MANUFACTORY.

CONSTANTLY ON HAND,

A Large and Complete Assortment

—OF—

MANILA CORDAGE,

FOR MINING PURPOSES.

—ALSO—

WHALE LINE, BALE ROPE, ETC.,

Manufactured from Pure Manila Hemp.

Hoisting Ropes for Deep Shafts,

—ALSO—

Lines for Ferry Boats,

Manufactured to Order.

Office at TUBBS & CO.'S, Nos. 611 and 613 Front street.

Manufactory at the Potrero. 14v10

METALLURGIC INSTITUTE,

McKibbin's Rolling Works, First St., Up Stairs

SAN FRANCISCO.

Practical instruction in ASSAYING by wet and dry methods, Roasting of Silver and other Ores by various methods, according to the character of the ore. Amalgamation, Smelting of Rich Silver and Gold Ores, Refining of Silver and Gold-bearing Lead, Blow-pipe Assays and Analysis. TERMS LOW. Chloration of Auriferous Sulphurets taught at an extra charge.

Young Gentlemen desiring a knowledge of the principles as well as the practice of Metallurgy, Mine Surveying, Topographic and every kind of Mechanical Drawing, accepted for a long term at $300. Hours of instruction—From 9 A. M. to 4 P. M.

REFERENCES—The first Mining Engineers and Metallurgists on the Pacific coast.

Formerly Superintendent of the Chloration Works, Nevada City, Cal; late of Kustel & Deetken's Metallurgical Works, San Francisco. 14v10

ORES WANTED.

Gold, Silver and Lead Ores Purchased.

OR WORKED BY SMELTING OR AMALGAMATING,

At my Metallurgical Works in the City.

Assay Charges for Ore.....Only $2.50.

Apply to J. MOSHEIMER, 14v10-1m 338 Montgomery Street, San Francisco.

AQUARIUM CEMENT.—We have several times been asked to give some reliable receipt for making a durable cement for an aquarium. Perhaps the following, from the *Scientific American*, may be new and valuable :—

One part, by measure, of litharge : one part plaster of paris; one part fine beach sand; one-third part fine powdered resin ; mix all together. This may be kept for years, while dry in a well corked bottle ; when used, make in a putty with boiled linseed oil ; a little patent dryer may be used ; it will stand water at once, either salt or fresh.

A cheap aquarium is made as follows :—

Cut a narrow groove in a board the size you wish ; set four pieces of glass on edge in the grooves ; put a piece of zinc in the bottom ; on the board make a light frame, the size of the top, with grooves ; pass a small rod through the frame down the inside of the corners, through the bottom, and screw up tight ; put the cement in all the corners, and you will have an aquarium at a very trifling cost.

WHO WROTE IT?—Who is the author of the following couplet :

"Count that day lost whose low declining sun
Sees at thy hand no worthy action done."

An exchange says : "Great efforts have been made to ascertain the authorship of this couplet, but hitherto without success. A gentleman in Cambridge advertises it twice a year in the Boston papers and offers a reward to any one who will discover the name of the writer who first gave it to the world. Similar advertisements have also appeared in the English journals."

THE ADDRESS to be delivered by Hon. A. A. Sargent before the State Aricultural Society will be upon the subject of the "Education of the Industrial Classes," and will have special reference to the foundation of an Agricultural College. Something valuable and emiuently practical may be expected from Mr. Sargent.

BLASTING

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.

Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10qy

THE MINING AND SCIENTIFIC PRESS is a large sixteen page (sixty-four column) weekly newspaper, especially devoted to mining progress, metallurgy, and kindred things. It is a most valuable reading journal, which has no superior on these subjects in America. It is worth, each week, a year's subscription to every miner, mill superintendent and prospector in this Territory, as it will tell them from time to time which years experience in mining cannot make them understand. Address Dewey & Co., Publishers, San Francisco. Subscriptions received, receipts given, and clubs and single names may be forwarded (by the publishers' request,) at our office and at those of the Register and the Journal, in the mountains, where sample copies can be seen from week to week.—[Rocky Mountain (Colorado) News.

Metallurgy.

EUROPEAN
METALLURGICAL WORKS,
— AND —
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties, on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

SILVER LEAD.—Some very fine specimens of argentiferous galena were received yesterday by Dr. Leach of this town, says the Fresno *Times* of March 22d, from the quartz vein recently discovered by Mr. George Rivercomb, near his residence on Dry creek, in this county. Upon being subjected to the action of fire, in a common draught stove, large globules of silver could be seen upon the surface of the quartz. In its characteristics it compares favorably with the Hubbard and Gorgonian leads of Owen's river; side by side, the difference is scarcely perceptible. Quite a number of claims are reported as located on the vein.

CHINESE SLAUGHTERED.—It is reported that a party of Chinese, numbering twenty-five, who left Virginia, Nevada, a week or ten days ago for Idaho, have been murdered by the Indians.

Machinery.

WM. BRUCKNER'S

Furnace for Roasting Ores,

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mule back, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an Iron Cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy It can be applied to any kind of ore, and the rapidity and perfectness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

6v10 No. 416 Market Street, San Francisco.

IMPORTANT INVENTION.

Hunter's Concentrator, Amalgamator and Separator.

For the concentration of Gold, Silver and Copper ores, and separating all kinds of metals from the sands, where the specific gravity of the metal is greater than that of the rock, a machine is now on exhibition at No. 521 Market st., above First, at BACON & WEBSTER'S Quartz Grinding Works, where it will be running from two to three o'clock P. M., for the inspection of all interested in mining. The Inventor is prepared to manufacture machines to supply all orders promptly. The sixth of a horse power is sufficient to run one of these machines. For the above machine a patent has been applied for. Orders for machines, or for circulars and further information, should be addressed to

ANDREW HUNTER, Inventor.

The following extracts from Reports are submitted to the public as giving the results of a fair working test of these machines:

BEAR VALLEY, DEC. 12, 1864.

MR. A. HUNTER—*Dear Sir;* I take pleasure in stating, in reply to your request, that your concentrator has now been running uninterruptedly, at Princeton Mill, for more than three weeks, and the enclosed notes, by the Superintendent Mr. Williams, of a carefully measured test of its performance during a period of a day and three-quarters, I believe fairly indicates what it has been doing through the whole of that time. First, the loss of the sulphurets, per cubic foot of tailings from the Concentrator, was about one-tenth of an ounce. Second, the loss of sulphurets from the blankets was nearly *fifteen times greater* than that from the Concentrator. The Concentrator has not been found at any time in the slightest manner out of order, and has required scarcely any attention. Congratulating you upon the these facts, I am, sir, very respectfully yours, FRED. LAW OLMSTED,
Manager Mariposa Company.

Notes of test run of Hunter's Concentrator—It having been supplied during the test with the sands reduced by one battery of the Princeton Mill, in the condition in which they are usually received by the blankets:—

Running time	1¾ days.
Amalgam saved on the plates of the Separator during above time, value	$6 76
Rate of saving of single machine per day	3 86
Rate of saving of six machines per day	23 16
Yield of Sulphurets, 1¾ days, pounds	215
Yield of Sulphurets, one days run of one Machine	123
Ratio per day of saving from six machines, being the whole number required for the Princeton Mill	738
Yield of amalgam from plates of Separator, per ton of rock crushed, value	55
Yield of sulphurets from Separator per ton of rock crushed, pounds	18

HANNIBAL WILLIAMS,
Superintendent Princeton Mill.

SAN FRANCISCO, DEC. 18, 1864.

I have recently examined one of Hunter's Concentrators and Amalgamators, in operation at the Princeton Mill, Mariposa Estate, the sand and crushed rock, flowing from one battery of four stamps, passing directly over the machine, without using blankets. On examination, it shows conclusively that the loss of sulphurets by the machine is much less than by the blankets, being but a mere fraction of the sulphurets, consisting of the light and fine scales, such as can scarcely be saved by panning; while on the other hand the tailings from the blankets contain a large amount of heavy sulphurets. The product of the machine is almost pure, clean sulphurets—the copper plates of the machine being amalgamated, securing much or all of the free gold that escapes the battery. I witnessed the cleaning up of the machine, and the collection of a ball of amalgam. From the weights taken we may state the constitution of this ore, as it came from the batteries at that time, as follows:

Clean Sulphurets containing free gold and amalgam	18.00
Quartz sand, waste	1981.75
Loss of Sulphurets and tailings	.22
Total	2000.00

WM. P. BLAKE,

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also, copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTINIC PRESS.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Constitution and By-Laws

March 31st, 1865. 13v10-3m

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE
ONLY PREMIUM
AWARDED FOR AMALGAMATORS
At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAKELEE,
O. GOAT, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.
19v9

Pacific
BEATER PRESS
Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.

The fact that Beater Pressed hay commands a BETTER PRICE in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Moulds, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

2v10 **General Agent.**

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

Hansbrow's
MINING PUMP.

Six-Inch Cylinder—Eighteen-inch Stroke—Four-Inch Suction—Three-Inch Discharge—Capable of Forcing Two Hundred Feet high with ease; Also—

HANSBROW'S FIVE-INCH DOUBLE CYLINDER,

A Powerful Hand Pump, throwing a two and a half inch stream; Also—

Hansbrow's Deep Well and Windmill Pump.

All Sizes for sale by

LOCKE & MONTAGUE,
Nos. 112 & 114 Battery Street. 2v10

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....250	913	Assay 300	990
Assay.....283	941	Assay for Czotman	980
Assay.....280	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	998
Assay.....	....Sr. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above Pans in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,
To whom all orders should be addressed. 15

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his Improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, necessary to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box; a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
1v10 Inventor and Patentee.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Rennes's nshes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address **J. B. BAUX,**

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Flowery Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, concentrate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, **B. FAUCHERY,**
Metallurgist. **Engineer,**

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LETCHER, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v10-3m

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA,

Founded In 1852.

The oldest Weekly Paper in the State, permanently estab lished, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

The Golden Era is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty-five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty six columns containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in the Golden Era.

The most popular Novels of the present day are published as Serials, from week to week, in The Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the Contributors to the Golden Era are all the prominent writers of Literary Repute in California, and on the Pacific Coast; also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States or Europe.

Serial Romances in the Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic periodicals.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by Pierce Egan, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE ECAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "The Fair Lilias; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,"..... ...by Charles Dickens.

TO ADVERTISERS!

Best Advertising Medium—The "Golden Era" is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village, and mining and agricultural precinct in California, and offers unusual and unequaled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

Golden Era Building,

643 Clay st., near Montgomery, San Francisco.

For a Sore Throat.—An excellent remedy for sore throat is, on retiring to rest, to rub on the outside a little volatile liniment, and swallow slowly a few drops of paregoric, letting it dissolve in the saliva, and spread along down the inflamed parts. The liniment is generally sufficient alone. Volatile liniment is simply a mixture of sweet oil and aqua ammonia (called liquid hartshorn). These are put into a vial and shaken, using such proportions as to form a semi-liquid soap. An ounce or two can be got cheaply at the druggists, and if tighly corked, it will keep for months. Rub it on with the fingers. We find nothing better than this for soreness of the chest or joints, or for lameness, stiff neck, etc.

A French engineer, it is said, has found a new route for a ship canal across the Isthmus of Panama, which will be a dead level from ocean to ocean, and will not cost over forty millions of dollars. It is asserted that no locks will be required.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this const of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Information Wanted.—A letter mailed at Nevada City, Cal., about January 28, 1865, signed by Jas. R. English, and addressed to this office, has failed to reach us, and we hereby offer a suitable reward for any information which may be given us of its whereabouts.

8v10 DEWEY & CO.

Spain, some three centuries ago, on account of her commerce, was the mistress of the seas; but want of attention to business education soon ruined her. Aspiring youths of America, learn a lesson from her, and take a course of instruction at the Pacific National Business College, conducted on the London Corn Exchange principles.

The Mining and Scientific Press.—We call the attention of our readers to an article from this valuable journal, explaining some of the reasons why it should be supported. We have no hesitation in saying it is one of the most deserving publications on the coast, in fact, the only legitimate mining journal in California. Every practical pick and shovel miner, as well as every man who may be anywise interested in mining, should have the *Press* for his own information, aside from its scientific value. Its editors and contributors are men of practical experience and qualified to speak that which they know.—*Grass Valley Union.*

"A Word to the Wise," Etc.—Parties in the Eastern States who desire positive information concerning the mineral wealth and developments of the Pacific States, should look for the same in some journal, published on this coast sufficiently truthful to enjoy a permanent circulation in the communities represented. Those credulous enough to patronize the mushroom bantlings of defunct California Jeremy Diddlers may expect to get "bilked."

A Valuable Newspaper.—The "Mining and Scientific Press," published by Dewey & Co., in San Francisco, is a useful and instructive journal for the miner and mechanic offering a vast fund of information respecting the working of metallic ores, the improvements in mining and other machinery, etc., etc. The Press deserves a liberal support from miners and artizans. Terms—$5 per annum, or $3 for six months.—*Placer Herald.*

Mining and Scientific Press.—This well conducted journa has entered upon its ninth volume. It it a sterling periodical, and deserves encouragement.—*Territorial Enterprise*

NOTICE.

And in accordance with law and an order of the Board of Trustees, made on the 10th day of February, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of the company, by Edwards, Olney & Co., on the 10th day of April, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. B. SHELDON, Secretary.

Office, 571 Mission street, San Francisco. mar25

THE "Mining and Scientific Press" is an excellent journal, and ought to be subscribed for by every miner and artisan on the Pacific coast.—*Nevada Daily Gazette.*]

UNASSESSABLE.

First National PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose.

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

D. S. CUTTER. W. H. TOBEY.

PETROLEUM ASPHALTUM and COAL AGENCY.

WM. H. TOBEY & CO.,
San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES.

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

MINING BLANKS
For Sale
AT THE
OFFICE OF THE MINING AND SCIENTIFIC PRESS,
Nos. 11 & 50 Government House.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186 , according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated 186

Assessment Notice.

..... Company

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ....., 186 , an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186 , in United States gold and silver coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186 , will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186 , to pay the delinquent Assessment, together with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

Delinquent Sale.

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186 , the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilus Thistle	23	14	$140 00
Peter Piper.....	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ..... , 186 , so many shares of each parcel of said stock as may be necessary, will be sold at the.....
....., on ....., the ..th day of....., 186 , at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

Office.....

FOR SALE BY

S. F. BUTTERWORTH,

Northwest cor. Battery and California sts.
v9-19 SAN FRANCISCO.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

HENDY'S IMPROVED BLOW-PIPE.

We give annexed a representation of a new and improved blow-pipe, recently invented by Mr. Joshua Hendy, of this city, and for which steps have been taken to secure letters patent. In our illustration the blow-pipe will be noticed fixed to a stand, convenient to the operator. The little globe attached to the instrument, and seen just over the right hand of the operator, constitutes the chief feature of the invention. It is nothing more nor less than one of the little toy gutta percha wind-bags, so common in toy shops, and may be readily replaced when rendered useless. It is attached to the blow-pipe by means of a nipple, being secured

with a piece of pack-thread. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows, and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion; when so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple, to which it is attached. The advantages are evident and manifold, as by this means a child may easily keep up a continuous blast for hours, which can be readily varied, as above, by a gentle pressure of the finger. All who have ever used the common blow-pipe are aware of the exhaustive and difficult effort to keep up a continuous blast. By this improvement the work is so simplified that the effect is scarcely perceived. To miners, assayers, jewelers, dentists and others, who have use for a blow-pipe, this invention will be found very valuable. Its cost is very moderate, the instrument being furnished for four dollars and a half, and can be sent enclosed in a small box, by mail or express, to any point desired. Orders, accompanied by the cash, forwarded to this office, will be promptly attended to.

IF YOUR STOCK IS ADVERTISED, you will find it noticed in our Shareholders' Directory, on page 232.

BAD POLICY.—Many of the Eastern mining companies, organized for working in this State, are having their mills made in New York and shipped to San Francisco. This is bad policy. Eastern mechanics are not familiar with the conditions and needs of California miners, and much machinery thus sent out is either abandoned on its arrival or used to great disadvantage. The difference between the cost of the machinery for a quartz mill sent out from New York and that constructed in this city, the delay and risk of a Cape Horn voyage taken into account, is but a trifle, if anything. The best policy for Eastern companies is to send their orders direct to our foundrymen, who are thoroughly acquainted with such business. We understand that a member of the Miners' Foundry firm, now in New York, has recently taken several orders in that city to be answered here. Other establishments in the city are doubtless receiving similar orders. We are persuaded that our Eastern friends can readily assure themselves of the propriety of our remarks, notwithstanding the apparently interested motives which might be supposed to influence us, on consultation with any intelligent California miner who might chance to be in New York.

FOR GLORY.—One Capt. Osborn, of the British navy, wishes his Government to fit him out an expedition to plant the British flag on the North Pole—all for glory! An exchange very properly suggests that Brittania would do better and acquire more "glory" by turning her attention to something more useful, say to the elevation of the condition of her working classes.

CAPITAL FOR OUR MINES.—Capital is essential to the development of our mineral resources. But few, even, of the most valuable mines will pay for their own development. Money is now very plentiful at the East—never more so, and it is cheering to learn that efforts of a legitimate character are being made to increase its flow in this direction.

HEAVY TREASURE SHIPMENT.—The Pacific Mail Steamship Co.'s steamer Sacramento, which sailed on Friday, took away $1,154,356; over one-half of which goes to New York.

FROM THE COLORADO.—Recent accounts from the Colorado, report that Capt. Truworthy has been able to take his little steamer up the Colorado quite a distance above El Dorado Cañon, and to a point within 400 miles of Salt Lake City. The water in this river is unusually low at the present time, yet Capt. Truworthy had no difficulty in reaching a point considerably above where he expected to find the limit of steam navigation. The Captain immediately proceeded to Salt Lake, visiting all the principal settlements on the way. He was everywhere received with many manifestations of joy at the success of his enterprise. This important enterprise is highly significant of the future of this magnificent valley, and public opinion is already setting strongly in that direction. A new and important chapter has been commenced in the history of Colorado and Arizona. We hear of new and important gold discoveries in Colorado, at the entrance of the next pass below Weaver's, in the mountains, on the Arizona side of the river, about fifteen miles from Olive City, and twenty miles from La Paz. The new placers are in what is known as "dry diggings," similar to that at Olive City, and quite rich. Nuggets weighing as high as four ounces are reported to have been found, and a number of men are said to have made as high as $100 per day at dry washing.

PETROLEUM AT NORTH SAN JUAN.—It is said that petroleum oozes out of a spring on the ranch of Capt. Dennison, near North San Juan. Persons well acquainted with petroleum pronounce it the genuine article. It stands in puddles all over one corner of his place, and it is thought that all the flat lands in the neighborhood are full of it. A company has been formed for the purpose of sinking a well and testing the matter. The occurrence of petroleum in the neighborhood of San Juan, should it be proven, may have an interesting bearing upon the study of the geology of that production, and possibly upon that of the age of the gold bearing rocks of California. Petroleum has been found in rocks of all ages, from the lower silurian to the tertiary period, conclusive. It is generally found in the greatest abundance, however, in sandstone, directly overlying limestone. We presume, however, it must exist, if at all in San Juan, in connection with a bituminous shale, and under conditions of great disturbances, such as would most likely render its occurrence in productive quantities extremely doubtful.

BORING FOR OIL.—Messrs. Cook, Doty & Cope are boring for oil in the Buttes, with horse-power. The gas comes out so strong as to throw the water out at the top of the hole. It will be remembered that these parties were running a tunnel for coal about one year ago, when the gas exploded in the tunnel, and hurt and badly frightened the men at work, an account of which explosion we gave at the time.

NEW MILL.—The Siskiyou Gold Mining Company, on Humbug creek, Siskiyou county, is about to commence the erection of a mill, with stamps and arastras, to be driven by one overshot wheel thirty-six feet in diameter.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction--A General Review--No. VII.

BY PROF. L. LANSZWEERT.

During my stay in Washoe, now the State of Nevada, for nearly five years, I availed myself of the opportunity to examine the many floating supposed improvements in the treatment of argentiferous ores. At one time, amongst the Washoeites, the excitement ran very high respecting the alleged wonderful discovery of a method by which silver could be extracted from its ores at a mere expense of about one dollar per ton, and it was claimed that the said discovery was in the possession of a number of capitalists, who intended with it to monopolize the business of reducing silver ores. Every one is acquainted with the fable of the mountain in labor producing a mouse; such a mean conclusion to such mighty throes is, however, transcendentally great as compared with that new *omnibus* metallurgic process. After giving this matter the deepest consideration, and re-consulting all the great authorities on this subject, in order to corroborate trials made, I find that any decided economy of management over what has already been accomplished and known to the initiated, is reduced to a very small compass. It may be well here to generally remark that, till this day, a very large amount of misdirected ability has been turned to this subject, in consequence of the complete ignorance of the parties as to what has already been accomplished in this well-trodden line. No branch of metallurgy has attracted, during the last century, so very large a proportion of the attention of the highest chemical intellects, to say nothing of the observations of the thousands of well-informed and intellectual practical workers, daily laboring at the business in England, France, Germany, etc. Notwithstanding the facts just stated—facts patent to all having any pretensions to common sense, and who are willing to exercise their reasoning faculties—new adventurers are constantly entering the field of research, with the hope of adding something new and valuable to the accumulated experience of centuries.

Because metallurgy, as applied to the reduction of silver ores, is new to the people of this coast, they imagine that it is little understood by others, also; and they fall into the great mistake of patronizing captains, carpenters, doctors, etc., who have till now imposed their imaginary inventions on the ignorance of our capitalists and bankers. I am charitable enough to suppose that McCullough, Smith, Veatch, etc. considered they had invented something really good; their knowledge of metallurgical science was not sufficient to qualify them for judging whether their processes were practical and economical for Washoe or not, whilst had they been better read, they would have known that all they proposed to do, had been made known before.

It may be well here to remark that the ores of silver comprise nearly fifty distinct varieties, not generally in separate forms, but in even varying complex relations and combinations, generally, in continually changing proportions, with more or less of the sulphides of iron, lead, tin, zinc, etc., and according to this admixture, combination or alloy requiring a varied process, each of which may require altering and in some cases reversing, according to the facilities or expense of obtaining power, water, materials, such as fire-bricks, chemicals, mercury, or other agents, fuel, etc. A deficiency of one or more of these, and others not enumerated, or the amplitude of supply by others in their places, may cause an intelligent metallurgist to completely vary, *successfully*, the ordinary processes. In truth, the great fact that ought to be looked for is not for any one to bring some *nostrum* as a specific, but to find out an intelligent operator, who knows how to make the largest return of per centage of the practical assay of the ore submitted to reduction, with the smallest amount of capital; and who ought also to reduce his expenses by extracting, when practical, other compounds of mercantile value, besides the precious metals contained in the ore.

[To be Continued.]

School Land Warrants.—The Supreme Court of California has decided that locations of School Land Warrants have no validity when made upon U. S. lands before said lands have been surveyed under the authority of the United States.

[Written for the Mining and Scientific Press.]

Letter from Professor Brewer.

Cambridge, Mass., March 11, 1865.

Messrs. Editors:—As I am stopping for a time in this place, so noted for the advantages it possesses for prosecuting studies or investigations in science, I have thought that some notice of its scientific institutes, and more especially of its collections, might interest your readers, all of whom have heard already more or less of them. I will notice first those of Cambridge, and afterwards those of Boston, beginning with the Botanical Garden and the Gray Herbarium.

In 1810 a Botanical Garden was established in connection with the University, which was got into actual operation about two years later. Its present director, and the Professor of Botany in the University, Dr. Gray, commenced his duties some twenty-three years ago, and under his auspices the institution has become the first of its kind in the United States. Bringing with him zeal, as well as knowledge, he has accomplished a great work. Making his first study North American Botany, for a quarter of a century he diligently brought together everything that would advance that end, not, however, neglecting other branches of that science. Books and specimens accumulated. Last year he offered his valuable library and herbarium to Harvard University, if a fire-proof building would be furnished to receive them. A liberal Boston gentleman, Mr. Thayer, erected the required building, at an expense of upwards of $12,000. It is not large, thirty-two by fifty-six feet, a story and a-half high, built in the most substantial and durable manner, with granite foundations, double brick walls, wrought-iron doors and slate roof. The principal room, for the herbarium, is thirty by thirty-five feet, and nineteen feet high, well lighted. It has an iron gallery around it, at eighty feet from the floor; only the portions below this are as yet occupied by cases. These are of chestnut, neatly finished. In addition, there are four smaller rooms for library and working rooms.

The herbarium contains upwards of 200,000 specimens, perhaps nearer 300,000, and is especially rich in everything that pertains to North American Botany.

The library, carefully selected, contains about 2,500 works, perhaps about 2,000 volumes, the money value of which is hard to estimate, as many of the works are very expensive and very rare. A recent donation to this, of 335 volumes, by J. A. Lowell, Esq., of Boston, would require several thousand dollars to supply.

An endowment is now secured to defray the necessary expenses of the collection.

In the Botanical Garden are extensive conservatories, where a large number of tropical plants are successfully cultivated. With the requisite means, how vastly finer such a department would flourish, under the clearer skies and more genial temperature of California.

Yours, truly, Wm. H. Brewer.

The Copper Interests of Amador County, and Its Future--A Hint to Capitalists.

Messrs. Editors:—Allow me, through the medium of your paper, so valuable to the mining interests of this State, to give a hint to capitalists, from which they might derive great profits. During the last two years, in several copper mining districts of Amador county, very busy times prevailed in prospecting for copper, in consequence of the development of the famous Union mine of Copperopolis. Thousands of shafts were sunk, though none of them with the success of the above stated mine; most of them, however, have struck veins of copper, at a depth of from forty to one hundred feet. As the ore they struck was of a quality not rich enough to be shipped, certainly it could not be converted into cash, to enable the companies, or poor miners, to continue work, and in consequence, many shafts showing fair prospects, were abandoned, and the money, as well as the labor, thus spent, rendered useless. As the ores around Forest Home and Willow Springs (and very probably throughout most of the Amador county copper district), have been shown to contain an average of from five to ten per cent., there *is* a way to have those shafts worked again—not only to the benefit of the owners, but also to the benefit of such capitalists or companies who may undertake to start a reducing establishment in the vicinity of that district; so much the more in favor of the latter, as the country thereabouts abounds in wood. It is strange to say, that in spite of such inducements, no attempt has yet been made to form a company for such purpose, as only a comparatively small capital would be required to try the experiment. A suitable furnace to reduce those ores into *regulus*, from about fifty to sixty-five per cent., in quantities of say ten tons in twenty-four hours, could be constructed at a cost of from $4,000 to $5,000. Are there not some parties to start such a company, which certainly would pay handsome dividends, more surely and sooner than any mine yet to be developed? If such an association be formed into 200 shares, of twenty-five dollars each, to be fully paid in, may there not be companies enough, having yet legal possession of their claims, each to take one or two shares? Surely, it would seem so; and I hope it requires only this hint to see such a company in operation before long. There is, for instance, the Cosumnes Company, near Mineral City (which, a few months ago, struck another vein of ore; it is pretended that it rivals with the best copper ores of Mexico, and the company will be paying dividends in a short time), which company alone would furnish enough poor ores, as also the Oriental, near by, to keep a reducing establishment of moderate dimensions working continuously; and there are lots of shafts in the vicinity abounding in such ores, which would be worked again, if such a market could be found for the product. I would instance the Lafayette, Big Indian, Fender, Pike, Rosecranz, Exchange, Star, Willow Spring, and others; also, the Spring, Catherine, Everlasting Maladrit, Pine-tree, Mountain, Union, Gambrinus, Belleville, Oakdale, and others, most surely would make new and vigorous starts. Soon larger reducing establishments would spring up, and in no very long period railroads would follow, to produce an abundance of this useful metal for exportation, to the benefit of the whole country, and of the good miners in particular. E. J. P.

Mining in Calaveras County.

Messrs. Editors:—I have just reached this point on my return from a tour through the mines, in the vicinity of West Point, in this county, and believing that many of the facts elicited will be of interest to your readers, I shall take the liberty of laying an account of my journeying before them.

Previous to leaving Mokelumne Hill, I spent a day very pleasantly and profitably in the vicinity of Chili Gulch. My companion and guide, while on this expedition was Mr. S. N. Parker, a very intelligent gentleman, and one who has done much to aid in the development of the mines in this region. The work here is mostly deep placer mining and is nearly exhausted. There are many quartz leads that look well on the surface, but very few of these have been prospected to any great extent. There are many gravel hills, which would doubtless pay well if worked by the hydraulic process, but the high price of water makes this impossible. Water costs, for large heads 33⅓ cents per miners' inch, and for smaller ones the price is correspondingly higher.

At four o'clock in the afternoon of the following day, I set out, and after a very pleasant walk of two hours arrived at this place. Here I was received with the greatest cordiality by Mr. T. S. Bever, the Post Master and proprietor of the Rich Gulch Hotel, whose polite invitation to spend the night with him I was fain to accept. In the morning, accompanied by my generous host, I set out for a tour of observation among the neighboring mines.

Half a mile below the hotel we came upon a party of Frenchmen, who were engaged in putting up a fifteen-stamp mill, to work the quartz taken from a ledge situated in the granite bluff on the south side of the Mokelumne river. A little farther down the bluff, towards the river, we came to what was once known as the Foote & Thomson mine. This mine was abandoned by the original owners after taking out a large amount of gold, from quartz obtained near the surface. It is now owned by Hepburn & Chapman of San Francisco, and Messrs. O'Neil & Gleason of this place are working it on shares. The ledge is about four feet in average width and enclosed in granite walls. The paying portion of the ledge is about three hundred feet in horizontal extent. Messrs. O'Neil & Gleason are driving a tunnel, which will open the lead 300 feet below the surface. This tunnel is now 600 feet long, and the contractors expect to strike paying quartz in 100 feet more.

After returning to the hotel we visited a small ledge, lately discovered a few hundred yards above the house, and owned by Messrs. Bever, Rider & Pickering, who have sunk a shaft on it some twenty-five or thirty feet. This lead is only about four inches in average width, but as the quartz taken out is very rich, and the walls being decomposed granite, easily excavated, it can be worked with profit while it lasts.

After partaking of our excellent dinner I parted from my generous entertainer and resumed my journey. Three miles along a fair mountain road brought me to Mosquito Gulch. Here are located two large mines, neither of which was in operation at the time of my visit. On one of these, the Vance, work was entirely suspended. On the other, Mr. Morris, the superintendent, is working a few men. This mine opens two ledges, the "Sam Brannan" and the "Mosquito," which are united in a part of their course. Where both are connected, the whole ledge is forty-two feet in width. The mine has been quite thoroughly prospected, and Mr. M. claims that the rock heretofore taken out has been uniformly rich. The company also own several hundred acres of timber land, and can readily obtain what fuel they need for their engines at very slight expense.

Three miles above Mosquito, and on the north side of the south fork of the Mokelumne river, is the village of Sandy Gulch. The mining in this vicinity is principally confined to small ledges of quartz, often yielding but a few tons. Mr. Harris of Sandy Gulch has built a small quartz mill for custom work, in connection with his saw-mill, and works the quartz from the various ledges in the neighborhood with profit to themselves and satisfaction to their customers.

About a mile from Sandy Gulch, on the West Point road, is the Middle Fork Mill, owned by Messrs. Henry & Laisher. These gentlemen own several ledges, but they are not sufficient to furnish rock for their five stamps, and they are able to do much work.

SCHMIDT'S MILL

Is situated on the middle fork of the Mokelumne, about forty rods above the one last mentioned, and is occupied solely with custom work. There are five wooden stamps by which the quartz is crushed to the size of walnuts, after which it is ground in arastras, which is the most popular mode of working here.

Another half-mile brought me to the village of West Point, one of the most thriving mining camps in the county. The country around West Point is mostly of granite formation, and the mining is now confined almost entirely to quartz. The ledges run north and south, generally dipping almost vertically, averaging about eight inches in width and generally of smaller extent. In company with Mr. Manly of West Point, I visited, during the afternoon, the mill of the

MINA RITA MINING COMPANY.

The mill is situated two miles east of West Point, and is well and strongly built. There are ten stamps in position, and room for ten more. This mill has failed to save the gold on account of imperfection in amalgamators, and is now stopped until it can be so changed as to allow amalgamation in the batteries. The Superintendent, Mr. Fred Morris, did everything in his power to make our visit interesting, showing us the machinery and the mines. The company own two ledges—the original "Mina Rita," and the "Lockwood" leads; the rock from both of which is very rich, both in free gold and sulphurets. The first of these is some twenty inches in width, and the other about one foot, and both promise to be more durable than most of those in this section. We next visited the

BELCHER MILL,

Situated a mile south of the "Mina Rita." This mill is driven by water power and contains eight stamps, five of which were running at the time of our visit. Jacob's amalgamators are used in this mill with fine success. The owner of the mill being absent in the East, the mill is being managed by Mr. Henry Sterling, who has leased it, and under whose care it remains very popular as a custom mill, in which capacity alone it is employed. After taking supper with Mr. S. we returned to the village a little wearied with our walk, but well pleased with our visit and its results. On the following morning I visited the

SKULL FLAT MILL,

Situated two miles above West Point, and owned by the Cassner brothers, who work mostly custom rock, though they own one or two ledges themselves. Last week, they crushed some very rich quartz from a ledge owned by Mr. Barnes, of Skull Flat. At the time of my visit they were crushing quartz from a mine of their own, situated about a

mile below the mill. This mill is driven by an overshot water-wheel forty feet in diameter and has eight stamps. Being located in the richest part of the district, this mill has plenty of work, and is a source of great profit to its owners.

After returning to West Point, I paid a flying visit to Pine Grove, Amador county, from which place I returned last evening. At Pine Grove I found a friend in the person of Dr. Cushing, superintendent of the Tellurium mine, who showed me the principal mines in the vicinity, and rendered me much service in every way.

THE TELLURIUM MINE.

So named on account of the amount of tellurium contained in the ore, was first discovered and opened by Mr. Kendall of Pine Grove, who, finding the undertaking too much for his means, sold out to a San Francisco company, who are preparing to work the mine on an extensive scale. The ore taken from the first tunnel driven upon the vein, is very rich, and continues on for some distance below, as is proved by a shaft sunk to the depth of sixty feet from the bottom of the tunnel.

The company are running another tunnel 130 feet below the upper one. They have just struck the lead in this, and have some good looking rock, though none so rich as that taken from the upper one. Mr. Kendall has invented a new quartz crusher, one of which, capable of working five tons a day, is on trial here, with gratifying prospects of success. If this crusher succeeds as well as it now promises to do, it will prove highly useful to prospectors.

D.

Rich Gulch, Calaveras county, April 8, '65.

GOSSIP FROM NEW YORK.

BY FRANK WARDELL.

MESSRS. EDITORS :—At the time of my writing great preparations are being made to celebrate our victories on the 4th inst. The signs look favorable for a splendid celebration. At one time affairs did not assume a very favorable aspect on account of a misunderstanding under which some were laboring, that the thing was gotten up as a political dodge by the Republicans, to make it simply a celebration of the inauguration of the President on that day. This the Democrats and anti-admirers of Lincoln "could not see." These difficulties, however, have now been amicably arranged, and it is understood that the celebration will be conducted as a purely Union demonstration, and the disaffected ones are gradually falling back into the ranks, and intend doing due homage to this day of glorification and merry-making. A telegraphic dispatch dated March 1st, from San Francisco, states that you all intend to participate and enter into the true spirit of the event.

As petroleum is taking such a prominent position among other stocks in California, I thought a few remarks regarding a late new invention, would prove interesting and serviceable. It is called

THE PETROLEUM TORPEDO.

This is the name of a very ingenious invention made by Col. Roberts of this city, and intended to be used for the purpose of exploding non-productive oil wells. It may not be known generally, by the public that three-fourths of all the oil wells sunk on an average, are non-productive, some from not striking the oil veins or pockets, some from becoming clogged up by paraffine and other sedimentary matter, and others from unknown causes. This invention consists of a cylindrical tube four feet in length, made to fit the bore of the oil well, which is filled with gun-powder, lowered by a wire into the well, to any desired point and there exploded by concussion, induced by an iron weight or follower, which is sent down the wire after the torpedo is lowered. The torpedo on being exploded drives out the paraffine or other coagulated matter, and at the same time opens fissures into the solid rock, very often leading into new veins or wells of oil. This invention has been applied in several cases at Oil Creek, and with perfect success. A company has been formed here and issued stock to the amount of $300,000 in 30,000 shares, at ten dollars each. The invention cannot fail to be of great assistance to the seekers after oil, as it may turn much unproductive property into the most valuable.

THE BANKRUPT BILL.

As I expected, the Senate on the 25th inst. refused to make the Bankrupt Bill the special order for the ensuing session. This action is as much as to say the measure will have the "go by." Our citizens have worked hard and prayed that some measure of commercial relief would take place. I do not speak alone of the almost unanimous opinion of the public, nor of the immense number of petitions sent into Congress from almost every quarter in favor of the measure. I refer, more especially, to the promptitude and energy with which the bill of last year was revived in the House at the opening of the present session. Congress had scarcely been called together a week when the measure was taken up and passed by a vote of seventy six to fifty-six. Since that time the only opposition offered to it has come from one or two second and third-rate Boards of Trade, that professed to find in this measure the appliances for a general whitewashing of rebel debtors. To meet these silly averments much argument was wasted inside and outside of the House. The measure had to be killed to gratify certain loyal citizens. It will be for the new Congress to revive it and give the relief so earnestly prayed for.

LAUNCH OF THE STEAMSHIP MONTANA.

Early on the morning of the 25th, the splendid side-wheel steamship Montana, built by the Messrs. Webb & Bell for the Pacific Mail Steamship Company, was launched from the yard at the foot of G street, Greenpoint. Her dimensions are: length, 330 feet; breadth of beam, 43 feet 6 inches; depth of hold, 27 feet; 4,100 tons burden. Her frame is composed of white oak, chesnut and hackmetack; floor of oak and solid the whole length of the vessel, futtocks of oak and chesnut, and top timber of hackmetack. She is braced with diagonal iron straps four and a-half inches by seven-eighths inches, running from heads of the floors to heads of the top timbers, longitudinal straps five by seven-eighths inches run completely around the vessel, at heads of timber, connected with and thoroughly bolted and riveted to diagonal straps. She has nine tiers of keelsons running fore and aft, well bolted to the floors. The bed keelsons for engine are each 60 feet long, 6 feet 6 inches high, and 4 feet 9 inches wide. These bed keelsons contain about 45,000 superficial feet of timber, and the keelsons altogether contain nearly 100,000 superficial feet. She has three complete decks, besides orlop decks. The beams of berth and main deck are yellow pine, and the spar and orlop decks of white pine. The outside planking of the ship is oak, garboard streak six inches thick, thence to lower turn of bilge four, and gradually increasing to wales, which are six inches thick. In order to increase her longitudinal strength, she has been double-planked from the flat of the floor to the lower side of between deck ports, with oak-planking three and a-half inches, crossing the inner course, all strongly fastened with copper bolts and locust-tree nails, wedged both inside and outside. In point of workmanship, model and finish, this ship will compare favorably with any ever built in this port. Her engines will be one hundred and five inches cylinder, and twelve feet stroke of piston and are being constructed by the Novelty Iron Works, of this city. In a few months she will be ready to take her position among the other steamships of the Pacific Mail Steamship Company.

DECLINE IN THE PRICE OF GOLD.

In reference to this subject, I make the following extract from the New York *Daily Times*, in which it says: In spite of protests from some of our cotemporaries we hold to the opinion that it will be much better for the country that the fall in the price of gold should be *gradual* rather than *sudden*. The *Tribune* cannot understand why any honest business man is to be injured by a precipitate fall of gold to par. Simply because business men have been compelled, if they would do business at all, to buy property at the high rates which the high price of gold has involved—and if they are compelled to sell it suddenly at very low rates, they are ruined by the operation. The *Tribune*, for example, may have bought printing paper at twenty cents a pound to last until July—if a sudden fall in gold and everything else compels it to reduce its price at once from *four* to *two* cents, it would lose very heavily by the operation. Now it may not have laid in any such stock of paper and so may escape; but merchants are compelled to buy very heavy quantities of goods at ruling rates, whatever those rates may be; and sudden changes, therefore, in the currency take them at a disadvantage. If gold were to fall instantly *to par* how many merchants or heavy business men in the country would be solvent at the end of a fortnight.

It seems to us much better every way, that the decline in prices should be so gradual that the losses inevitably involved should be shared by the whole community, and not fall on special classes, or a comparatively small circle. They will thus be much less oppressive, and the disturbance of the general course of business will be much less injurious.

WASHINGTON RECEIVING A SALUTE ON THE FIELD OF TRENTON.

A very fine engraving of this celebrated picture has just been published by the Art National Association of New York. The original picture is the joint production of Mr. J. Faed, R. S. A., and P. Aosdell, R. A., and represents the hero seated on his favorite charger, receiving the salute of the passing troops. The engraving, which is a large size, is the work of M. W. Hall, who has been engaged upon it for several years. It is in the highest style of the art, and Mr. Hall has succeeded in transferring to the engraving all the spirit and beauty of the original picture. The directors of the Association have received numerous testimonials to the beauty and fidelity of the work, and among others, from the late Edward Everett, Prof. Longfellow, Secretary Seward, Gen. Scott, and Fred E. Church, the well known artist. I do not know when I ever took more real pleasure in viewing an engraving than this splendid work of art. No doubt Messrs. Ross & Wunderlich of your city, will have it on exhibition soon.

CHANGE IN LIFE.

Jacob Little, of New York, the world known financier, whose name has been made "familiar as household words" in Wall street, more particularly for near half a century, is seriously ill, so much so that his life is despaired of. His disease will probably culminate in the softening of the brain. Years ago, Mr. Little was the king of Stock Boards, and his transactions would amount to millions in the course of a day. But with age came repeated reverses, against which he was less and less able to contend, and eventually he gave place to younger men. Thus you see we are unable to tell what a day may bring forth. Who would have thought that such an operator as Mr. Little, then worth his millions, would now be reduced to such an ordinary condition in life?

PROFESSOR B. SILLIMAN.

This popular and scientific gentlemen is in favor the people of Gotham with a lecture on the wonderful mineral resources of California, at Cooper Institute, on the evening of the 6th. It will be largely attended, no doubt, and will prove interesting and valuable to those interested in your mines.

NEW SECRETARY OF THE TREASURY.

From what I can learn, and coming as it does, from very reliable quarters, Mr. McCullough is destined to be our new Secretary of the Treasury. He is an able financier, and I think will prove to be one with a watchful eye in not having the national debt increasing too fast. He is one of those independent spirits who desire no instruction from the outside.

FRANK BAKER BOUND FOR EUROPE IN STYLE.

For some time past there might be observed at the New York House a card to the effect that Mr. Frank Baker desired to sell out his entire fast stock, carriages, etc., etc., on account of his departure for Europe. I believe he sold out his establishment, consisting of some nine horses, mostly blooded stock, a variety of equipages, etc., which realized him in the vicinity of $40,000, (rather a good sum to have in such articles, thinks I to myself). Well, being tired with the road, he has, from appearances, taken to the life of a yachtman, having had built a magnificent yacht expressly for his European trip—in which he took his departure yesterday. The name of his craft is the "Alarm," and the knowing ones say that he will *alarm* some of his English cousins in the way of speed before he returns. We wish friend Frank a jolly time, and may he soon return to New York and try his hand again in "selling short" on Harlem—that is if Vanderbilt is out of town. I would not like to see him do it otherwise, for I think Cornelius is to much for Frank and his crowd on combination and corner enterprises. If Sanborn, Jack McKenty, Budd, Dick Berry and Perry were here to "bolster" Frank up with systematic dodges, etc., why there would be a probability of his coming out winner.

Historical Sketch of Petroleum.

The remarkable changes in the economies of life and industry which petroleum has of late years been the means of effecting, have given that peculiar article an important place in the list of our commercial materials, and to a large extent made it a prominent agent in the regulation of exchanges.

It is no new discovered substance, however, but has been known in all ages of the world. The earliest mention of it is found in the Bible, which speaks of it as one of the ingredients in the asphaltic mortar use in building the Tower of Babel; and it is evident, from examination of any of the ruins of Mesopotamia, that the same substance, evaporated to a pitchy condition, entered largely into the cements employed in their construction. The Babylonians obtained it from the sulphur, brine and oil-springs of Is, the products of which are still sold in the village of Hits.

Oil springs, indeed, have been known and esteemed, and even worshipped in every age and in many countries. The petroleum used by the Egyptians in embalming the dead was obtained from Zante, one of the Ionian Isles, and the "Greek Fire" of more modern times was probably compounded of petroleum from the same source. Dioscorides tells us that rock oil was collected in Sicily and burned in lamps in Agrigentum. The classic home of naptha, however, is Baku, a high sterile peninsula on the western shore of the Caspian, where inflammable gas rises everywhere from the saturated soil, and miniature volcanoes discharge volumes of oily mud, and, from the time of Zoroaster, the naptha of Baku has been sent all over Asia for the service of the sacred fire of the Parsees. At Balegan, in this district, the sides of the mountain stream with black oils, which collect in reservoirs constructed in an unknown ancient time. The population use the oil for light and fuel, and coat the roofs of their dwellings therewith. No wonder the religious sentiment of the Oriental mystics was entranced by such a land, where, in the fissures of the white and sulphurous soil, the naptha vapors flicker into flame; where the boiling lake is covered with a blaze devoid of sensible heat; where, after the warm showers of autumn, the surrounding country seems on fire, flames of enormous volume rolling along the mountains, where in the still nights innumerable jets of flame, isolated or in crowds, cover all the plains. The Gheber and the chemist here may work side by side. All the phenomena and distillation and combustion, under varying barometric and thermometric conditions, may be studied, for none of this general fire burns unless when captured and applied to human uses in the lamp, or stove, or kiln. In the midst of this element—this flame world—men live and love unharmed, tend sheep, plant onions, sleep, are born and die, as in more prosaic regions. The flowing oil and the burning gas are equally harmless.

From periods coeval with the first dawn of Eastern history, the Burma Empire and Northern Hindostan have received annual supplies of rock-oil from the wells of the Himalayan valley of the Irrawaddy through Rangoon; and it has always been a favorite drug in Hindoo pharmacy.

In Italy, the oil wells of Parma and Modena date back nearly two centuries. The springs of Ammiano have long lighted the streets of Genoa.

In France, oil springs have been known from time immemorial at Clermont and Gabin; and in the canton of Neufchatel and in Bavaria.

In the English coal mines, the coal oil gas—the dreadful fire-dump—was always a well known demon in the mining population. More than two hundred years ago (1659) it was described by Shirley as an illuminating gas, and in 1733 Sir James Lowther laid pipes along his mines and burned the gases at the surface of the earth. Dr. Clayton's retort experiments were some six years later. From these the whole modern system of illuminating with gas has had its origin; and coal gas has become the illuminator of the civilized world.

REACH OUT FOR HEAVEN.—You long for the bread of God to come down from Heaven, and give you life such as the angels enjoy, do you? You long for a warmer, tenderer, more of the true neighborly love, do you? You yearn for it, and pray for it? Then go out of yourself, and try to live for others. Try to do something to dissipate the darkness, to lessen the burdens, to alleviate the sorrows, to multiply the joys, to smooth the rugged pathway of some neighbor.

Try to extract some rankling thorn, or to pour a little oil and wine into some bruised and wounded soul. Seek out some friendless and needy object, on whom to bestow your sympathy, your generosity, your offices of kindness. And you need not go far; such objects exist in scores all around you—objects needing sympathy and comfort, if not material aid. Do this, and see how your cold and hard-hearted selfishness will begin to diminish, and your neighborly love increase! See how the windows of Heaven will be opened within you, and your before waste and barren soul begin to be flooded with the gracious outpourings of love from on high! It is the outgoings of our own thoughts and feelings with intent to bless, that cause the plentiful incomings of the divine love and mercy, agreeably to the divine declaration, "Give and it shall be given unto you."—*Religious Magazine.*

THE Alton, Illinois, sporting people are offering to bet largely that the Mississippi will break through, this Spring, into Long Lake, opposite the mouth of the Missouri, leaving St. Louis high and dry eleven miles from water.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, April 15, 1865.

The money market is somewhat easier, although a fair demand continues to prevail in Bank at former rates—1½ ₱ cent. per month—upon acceptable securities. On the street there is an active requirement at 2@3 ₱ cent. per month, and some of the collateral offering is not of a satisfactory character to parties in the habit of loaning in this manner.

The receipts of treasure in this city from all sources, during the quarter ending March 31st, including coin and bullion, have been as follows:

From California and Nevada	$12,676,864
From British Columbia	149,850
From North Coast	687,532
From Southern Coast	111,568
Imports, Foreign	288,058
Total	$13,913,872

The comparative aggregates for three years were as follows:

1863.	1864.	1865.
$11,712,090.	$12,844,610.	$13,913,872.

The product of the mines on this coast, received through the regular channels, for the above named period, was:

1863.	1864.	1865.
$8,808,906.	$10,842,306.	$12,169,930.

These figures show a gain this year over last, of $1,327,544, and over 1863, of $3,361,024.

Nevada has produced this year, thus far $4,350,000, against $3,300,000 last year, and $2,400,000 in 1863. The receipts in private hands at this period of the year, are usually less, proportionably, than at other seasons, and the first quarter of the year is generally the least productive.

COIN ABSORBED IN THE INTERIOR.

The following figures serve to show, in some degree, the currency movement of the past quarter:

Coin remitted to the interior	$2,356,635
Coin received from the interior	1,468,894
Added to interior circulation	$ 887,741

The mining share market has been characterized by the usual activity of a month past, and nearly all leading stocks continue to be sought for at enhanced rates. We can learn of no material change this week in the general appearance of the Comstock lode. Developments are going on all the time, and a larger yield, from most claims, seems to be confidently looked for at an early day. Nearly every mill in Nevada, available for the reduction of ore, is now actively employed, and the bullion product of that State is likely to exceed $5,000,000 the ensuing quarter.

Legal Tender Notes have attracted less attention this week, advancing from 66 to 72c, buyer 10, receding to 69, rallying to 70½@71, and closing at 71 bid, 71½ asked. The total sales amount to $385,000 par value. The disbursements of the Government in this city during the past quarter, amounted to $4,000,000, as against some $3,000,000 for a corresponding period of last year. Latest telegraphic advices from New York quote gold at 146 on the 14th inst.

City stocks are dull, but well maintained. Pacific Insurance Company was sold at 140, and is now held at 141. A dividend of $6 ₱ share, for the past quarter, is payable to-day. California Steam Navigation is in more favor, advancing to 73 bid. A dividend of 2 ₱ cent. on the capital stock ($1,000 per share) is now payable.

Yellow Jacket has materially improved and 35 feet were sold, advancing from $2,225 to $2,530, declining to $2,425, rallying to $2,525, receding to $2,450, and closing at $2,400. In drifting and cross-cutting on the lode, 100 feet south of the shaft, large deposits of good ore have been met with recently, and indications point to the further continuance of a valuable pay vein in that direction. The product of the mine has averaged 300 tons of ore per day since the 1st inst., and the receipts of bullion for the current month will probably equal those of March.

Gould & Curry is now but little dealt in, and only 7 feet were sold; dropping from $2,025 to $1,985, rallying to $2,000, and closing at about $2,000 asked. The yield of the mine for the first half of this month has been about $100,000 in bullion.

Savage declined from $2,040 to $1,975, advanced to $2,025, dropped to $1,965, rallied to $2,030, and was held at the close at $2,025, within which range 23 feet were sold. There is no change to note in the appearance of this mine, so far as we are advised. Receipts of bullion continue fully up to the average of the past two or three months.

Belcher has been active this week, and 50 feet were sold, advancing from $1,710 to $1,800, receding to $1,775, rising to $1,850, declining to $1,765, rallying to $1,780, and closing at about $1,750. This claim bids fair to become a leading one, and the character of late developments is such as to warrant the expectation of increased dividends to stockholders. At the greatest depth yet attained the ore is improving and larger deposits have been developed in drifting north.

Crown Point rose from $1,360 to $1,425, declined to $1,370, and sold yesterday at $1,360. In all 34 feet changed hands. We learn of no new feature in this mine. Operations are progressing vigorously in the preparation of new and more efficient hoisting machinery.

Chollar advanced from $905 to $1,000, receded to $942½, rallied to $975, declined to $805, recovered to $820, and closed last evening at $830; within this range 275 feet have been sold. Some 80 tons of ore are now daily taken from the north mine, averaging $40 per ton. Potosi has also been actively dealt in, and 189 feet were sold, advancing from $860 to $1,020, buyer 30, dropping to $830, rallying to $875, and closing at about $850. Operations in this valuable mine are now about to be conducted under a new management, and further litigation will cease, a consolidation with the Chollar Company having been definitely determined upon. The details of this settlement have not as yet been fully arranged, but there will probably be an equal distribution of stock, each company representing 1,400 feet, and a joint assumption of what is known as the Grass Valley debt. Other liabilities of the two companies will doubtless be paid by each separately.

Ophir has been more active than for some time past, and 78 feet were sold within a range of $570 and $600, closing at about the latter figure.

Empire Mill & Mining Company has receded from $500 to $460 per share. Hale & Norcross has been in much better request, advancing from $460 to $630, declining to $560, and selling yesterday at $585. At these rates 55 feet were sold.

Uncle Sam rose from $305 to $330, fell to $300, rallied slightly, and was sold at the close at $302½—132 shares in all changing hands. Overman was sold at $325 and $310 per share. New certificates are to be issued next week and work upon both the Uncle Sam and Overman claims will now be actively resumed.

Imperial rose from $212 to $213, declined to $210, and closed at $210 bid; 156 shares were sold. The lower portion of the Alta mine is improving, and preparations are under way to develop the Logan & Holmes ground.

Bullion rapidly advanced from $100 to $180, buyer 30—assessment of $30 delinquent—declined to $145, and sold yesterday at $145.

Nevada (J. G.) revived this week, advancing from $25 to $65, dropping at $56, and closing at about $63.

Burning Moscow is also in better favor, and steadily rose from $37½ to $45, selling at the close at $43. Wide West rose from $14½ to $20, and dropped to $15. Caledonia Tunnel rose from $10 to $16. Sierra Nevada was sold at $25@24; Real del Monte at $14@15; Daney at $15; Lady Bryan at $8½@9; and North American at $34.

The aggregate sales of stocks and Legal Tender Notes, since Saturday last, amounted to $1,241,917.

Mining Summary.

CALIFORNIA.

Much attention is being devoted at the present time, in various portions of the State, to the problem of rendering valuable the large quantity of copper ore now at hand of too poor a quality for shipping. The series of articles which we have recently published from Dr. D' Hierry, upon this subject, appears to have done much towards convincing the most skeptical on this point, that a large portion of these ores can be readily made productive by a furnace process. Fortunately, just as he had closed his series of articles, setting forth the theory of this process, we have a practical illustration of their correctness and practicability, exhibited at the works of the Union mine in Copperopolis, where copper is now being produced, almost entirely after the method described by the Doctor. We have thought this a matter of sufficient general interest to dwell upon at considerable length in the present issue, to which article we would refer our readers. We shall watch with much interest for further developments from Copperopolis. We should also be pleased to learn further of what progress is being made in this direction in Plumas county. Our present *resume* of mining matters throughout the State, presents nothing of particular interest beyond the fact that a season of general prosperity is now existing everywhere among the mines.

KLAMATH.—The recent rains were very heavy in the northern part of the State. The Klamath *News* says that the miners in that section, who depend upon water taken from the small creeks and gulches to work their claims, have fine prospects for a long and profitable season's work, and consequently are in good spirits and working away cheerily to make the best of it. The *News* says there are numerous banks and beds, with living streams of water in that vicinity, which are yet unclaimed. The fear of Indian disturbances which, for a time, kept miners from that section, is now removed, and a fine field is presented, which has been but little worked.

PLUMAS.—We learn from the Quincy *Union* that the Premium Quartz Company have struck the ledge in their tunnel, and the quartz looks and prospects well. The tunnel is about 275 feet in length.

The Indian Valley Company's mill has commenced running again as a 20-stamp mill. The Eureka Company's mills have also re-commenced running. The copper smelting works in Genesee Valley were recently fired up anew. We have no particulars with regard to their success beyond the first day or two.

PLACER COUNTY.—The Auburn *Stars and Stripes* thinks the silver discovery near Dotan's Bar is very valuable. Mr. Layne has sunk a shaft to the depth of 55 feet through rock which, it is claimed, assays on numerous tests, $200, $300, and all the way up to $700 to the ton. Of a heap of ore scattered around the shaft, and tried promiscuously, we saw none which, on being roasted, failed to exhibit a gratifying sprinkling of silver globules. A mill is being erected for the purpose of thoroughly testing the various classes of rock. The company have now ready for crushing over 75 tons of selected rock, from which they expect to realize a pile of silver bricks; and from all the indications, tests and assays we have no doubt they will.

The quartz veins below Illinoistown, on the divide between the waters of the North Fork of the American and Bear river, says the Auburn *Herald*, have for some time past attracted the attention of the miners—from the fact that the indications are favorable for developing valuable leads. A number of claims have been located, and a mill that was erected last year, has been running with good results. The quartz veins are believed to be a part of the Grass Valley system, as they have the same direction and are but twelve miles distant.

Considerable prospecting is also being done between Auburn and Bear river, in the vicinity of the Grass Valley road.

At Quartz Hill, the locality of the rich strike noticed several months ago, several companies are at work sinking shafts, confident that there is plenty of good quartz that will repay the labor of expense and work. Many claims have been taken up, and a season of busy prospecting is contemplated.

The first discoverers, under the name of the "Green Emigrant Company," have also gone to work, and are putting up arastras for a further prospecting of their claim.

NEVADA COUNTY.—The Grass Valley *Union* chronicles rich strikes in the Keystone, Blazing Star and Little Annie claims in the vicinity of that town. The editor has also seen two bars of bullion, weighing 525 ounces, and $8,500, from the Heuston Hill mine, the result of five days' run.

A ledge, 18 inches in thickness, and rich in sulphurets and free gold, has been struck near the French Mill, after running in a tunnel 120 feet.

Messrs. Niece and West, operating at Brown's Hill, near You Bet, have commenced putting up a mill on their place for the purpose of crushing the cement, which is too hard to be reduced by washing. We have already noticed the proposed erection of this mill. They expect to have it in operation by the 1st of June.

A new ledge has recently been discovered near Nevada City, two assays from different croppings of which, made by J. E. Squire, gave $76 and $111 to the ton.

The *Gazette* is informed that a large vein of very rich sulphurets has been struck in the Providence mine, on Deer creek, below Nevada, which gives every indication of holding out well. The owners of the Providence think they have a good thing.

The Pennsylvania mine and mill, located about midway between Coyoteville and the Sugar Loaf, recently cleaned up over $2,000 for a nine days' run. The *Gazette* says they expect to do much better after their machinery gets to running smoothly. The example of the Pennsylvania Company shows what may be accomplished by perseverance and industry. They have had a pretty hard tussel with fortune, and have come off victorious. They have one of the best ledges in the county, and deserve their good fortune.

A promising strike has recently been made just south of the French mill. The ledge is about 18 inches thick, rich in sulphurets and exhibiting some free gold. It occurs just between the slate and granite, and should consequently be a true and reliable vein. A crushing will be got out as soon as possible, and the proprietors look for a handsome yield.

The *Transcript* is informed that a one-sixth interest in the Sneath & Clay ledge, located on Gold Flat, has been sold by George Sneath to Thales Curtis.

The Dutch claim at Buckeye Hill, owned by Huffman, Muller & Co., after a week's run, yielded $1,700. This is about the average yield of these claims.

AMADOR.—The Jackson *Ledger* says that the Italian mill, near Pine Grove, 10 stamps, recently cleaned up $8,900, being the result of 16 days' run. Since the beginning of the winter rains this little water mill has crushed out about $10,000. Five tons of rock from the Tellurium lode, crushed by Kendall's "Little Devil" machine, yielded $30 to the ton—rock not selected.

MARIPOSA.—Quite a rich pocket was struck on the Mariposa vein last week, near the place where the Linds took out a large amount several years ago.

HUMBOLDT.

The local paper at Humboldt county, Nevada, expresses much gratification at the evidences of an early improvement of the mines in that section. It says that several of the most able companies have, for different reasons, allowed operations to be suspended for a time, and that cause has contributed largely to the discouragement of companies having shorter purses, and at the same time has done its share towards establishing the disgusting quiet which a mining community so abhors. The Sheba and De Soto, at Star City, are preparing to resume work this month. The latter purposes putting a large lot of ore, now out, through the Sheba mill, while the Sheba Company opens up shafts and drifts for working the last floor of ore struck in that mine. The American Basin Company has got its affairs nearly righted again, and has resumed work, with excellent prospects of a big strike in course of the season. The Whitmore goes steadily forward with its handsome tunnel.

The Atlas Company and the Manitowoc will soon commence bringing down ore again. The little mill in the upper town is getting up its water-power, and will in a few days be crushing National rock. The Nevada Company is going on with its tunnel, expecting in a week to cut the ledge at a depth of not less than 300 feet. The men passed through a vein of quartz this week, bearing considerable quantities of ore, and a stuff supposed to be "Aikinite." They think the ledge cannot be far off.

The Gem Company, in Sierra District, is yet at work, as it has been all winter, sinking a fine working shaft, through which to work that excellent mine. Fall's mill is this week running on some second and third-class ore from the mine. The first-class ore, we believe, is shipped.

The Copp Company is still at work, opening up the well-known Badger and Annie ledges. The Tallulah will probably resume work in a few weeks.

The Montgomery Company, with James Montgomery as Superintendent, is at work developing its mine in Humboldt District.

Mill City begins to loom in the premonitory shadowings of a town to be. Dickinson, of the Ætna mine, in Prince Royal, is having a 20-stamp mill built in San Francisco, to be put up at Mill City. He has two small mills on the way from New York. These he will probably put up somewhere in the mountains.

In Santa Clara, the Little Giant Company's tunnel is worrying in through the very hard rock. The Butte Company is at work.

In American District, the owners of an extension of the Westerfield are at work to develop their claim.

In the Sacramento District, the Daniel Webster Company is progressing with its tunnel. At Williamsburg, the St. John and other companies are working. The St. John turns out some marvellously rich silver ore.

In Trinity District, the Evening Star Company is doing good work, putting the incline down far below the water. The ledge was very rich and slowly widening when we last heard from it.

Work on the Humboldt Canal has been resumed since the frost left the ground. A full force of men, teams, plows, scrapers, etc., is now at work.

REESE RIVER.

The huge piles of silver bricks daily pouring through Virginia City, according to the *Enterprise*, afford most unmistakeable evidence of the value of these mines. Starting at a figure so light as to be scarcely worth noting, the shipments of bullion from Austin have been steadily increasing. "Week by week," continues that paper, "we have marked this, and have noted it with the greatest satisfaction. We are not foolish enough to claim or to wish for our own district the only paying silver leads. We firmly believe and most earnestly hope that there is not a single district lying to the eastward, in which miners are working, but contain most valuable mines. The great change which has taken place in all the leads in that section of the State which have been sunk upon to the water level—the splendid appearance of all the ores lately brought here from the mines in these districts, warrant us in saying and believing as much."

A gentleman from Reese River informs the Carson *Post* that twenty new mills will be erected and put in operation the coming Summer. He also says that the work is in the hands of New York capitalists, who propose to invest eighteen millions in the mines. If this estimate is correct, the people of Lander county may safely calculate on lively times the present season, and Storey county must look out for her laurels.

WASHOE.

According to the Gold Hill *News*, mining is looking up all through Storey county, and very many claims that have been supposed by outsiders to belong to the *genus feline*, are soon to be worked by confident owners. Mines of every established wealth are daily increasing the amount of their shipments; ledges almost entirely unprospected are to be worked, and new discoveries are to be made in all sections.

The Gould & Curry Company have commenced the work of removing to the surface the large engine which they have been for some months using within their mine, on the lower level. It will be sent up and used for hoisting purposes at the Bonner shaft, on D street. Owing to the swelling of the earth, the timbers of the underground engine house were so badly crushed as to render it very unsafe, and it was thought best to remove the machinery to the surface.

Mr. Davis having resigned the Superintendency of the Ophir mine, Capt. Wm. Blanding, the President of the company, has been placed by the Trustees, in charge. Capt. B. was President of the company from its organization in May, 1860, to December, 1862. He has entered with zeal upon his work, and is ably assisted, says the *Enterprise*, by the other officers, Messrs. C. M. Lightner and James W. Dickey. The restoration of the mine to its former good fortunes will do much to add to the growing confidence in the stability of our mines, and we heartily wish them good luck. The attention of the present officers will be principally given to the rushing forward of the new shaft and the extraction of the ores remaining in the upper levels. We hope to see the Ophir take proper shape, and work in the lead, prosecuted in an efficient and systematic manner.

The Minerva Company, at Gold Hill, have started their fine new hoisting works. They have a splendid 75-horse power engine, and all their machinery is of the latest and most approved pattern.

A mill will shortly be in operation in the Desert District. It is also reported that new mills will be erected in Mountain Wells and Pine Wood Districts this Spring, by companies formed in the Atlantic States.

The Occidental Company, in Silver Star District, is still taking out rich rock. They have lately purchased the only title that conflicted with their claim, which gives the company everything within a strip of ground five hundred feet in width along their lead.

The Daney, which two years ago went up to $500 per foot, and then fell to almost nothing, appears to be again showing signs of vitality, good ore having been reached in the shaft. The company owns one of the best mills on Carson river, within one mile of their mine, with a good road connecting the mine and mill.

ALPINE COUNTY.—According to the Monitor *Gazette*, the various companies in Alpine county are preparing to re-commence operations by the 1st of May. The Vertex claim has recently been sold to New York capitalists for $25,000 in currency. The attention of Eastern capitalists is being drawn to that region.

ESMERALDA.

There appears to be nothing of special interest for Esmeralda beyond a reported rich strike in the Bodie district, the particulars of which have not yet come to hand. The *Union* is informed that a company, composed of the principal property holders of Aurora, is being organized for the purpose of thoroughly developing, at a great depth, one or more of the prominent ledges of this district. The object of the move is to thoroughly develop the mines at a depth of 400 or 500 feet. The deepest shaft in the District has reached a depth of only a little over 250 feet—a depth at which well-defined ledges are frequently barren, even in Districts 1,000 or 2,000 feet less elevated than this.

The *Union* very properly adds that one of the greatest injuries to all quartz mining localities is the frittering away of labor and capital upon hundreds of claims, and properly developing none. Virginia District has suffered greatly from this same cause—hundreds of thousands having been squandered there on wild-cat, to give it a fictitious name in the market for the benefit of jay-hawkers and stock-sharks.

* * * Let us profit by the experience of others, and concentrate labor enough on a few good ledges to develop them thoroughly, and we will thus add another great tributary to the river of gold and silver now flowing from the Pacific coast into the channels of commerce in every quarter of the globe. Let our mines be thoroughly developed, at a depth of 500 feet, and we believe they will then compare favorably in wealth with those of any other district in the State.

THE PETROLEUM INTEREST.

The oil discoveries of California are fast assuming a tangible shape. Some of the most substantial men in San Francisco are becoming interested in the enterprise, and have taken hold of the matter with a determination to give it a fair and thorough trial. A large number of wells are now being put down, but the work appears, as a general thing, to move slow. Practical investigations have fully proven that the crude petroleum of California, upon and near the surface, is purer and exists in much greater abundance than in any part of the Atlantic States. In Humboldt and Colusa counties it is found sufficiently pure to burn, in its crude state, just as it is taken up from the springs. Of course, in such condition it is not a merchantable article for illuminating purposes, but it answers a much better purpose among the ranchmen of Humboldt county than the ordinary tallow "dip," so generally used upon ranches. For lubricating purposes the petroleum of California is far superior to the generality of that which is found at the East—in other words, California will produce a heavier and more valuable natural article than the Atlantic States. We have been assured, by a chemist of undoubted veracity, that oil which has been submitted to his inspection as coming from the Adams well, at Mount Diablo, is worth $1.60 in its crude state, for lubricating purposes! The genuineness and value of California petroleum is now a matter beyond a doubt, in the minds of those who have thoroughly examined into the matter. The next question to be decided is as to its quality. We have seen many intelligent oil-borers from the East, who have examined our indications here, and have yet to find the first one who entertains any doubt on this point. The operations now in progress will soon settle the matter in that particular; and that done, the capital now interested will soon provide all the means necessary for the erection of refineries, etc., to create a home market for it, at once, and also to enable us to compete with our Eastern friends for its disposal in foreign markets.

IN England a restriction is placed on the gas companies by law so that if the dividends exceed a certain percentage, the surplus falls to the Government.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured to the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

SMELTING OF COPPER AT COPPEROPOLIS.

We do not like to intermeddle in the affairs of any mine; but we must make an exception at present. The Union Copper Mining Company, at Copperopolis, has boldly commenced the reduction of its copper ore, and the investigation of this enterprise and of the results obtained belongs to the public. It is a private business which becomes, by the event, a business of general interest, for its result must have an influence upon the future of our copper mines in general. Now that the rich outcropping ores have disappeared almost everywhere, the calculations and assays tried on every hand have proved, superabundantly, that the copper pyrites cannot, as a general thing, be exported with a perceptible profit. A general uneasiness has consequently shown itself among our copper miners, and most parties interested are turning their attention toward the only means of safety—reduction.

We believe it to be our duty to favor this movement as the true direction which this great mining industry should take, and by following which it will ere long become more profitable and more durable that the working of our mines of gold and silver.

Dr. Paul D'Hierry, in his "Metallurgy of Copper in California," which we have given to our readers, has already dissipated many of the prejudices which unskillful experiments had raised against the reduction of copper ores on this coast. Since those papers have appeared, we have found them fully illustrated in practice. The Union mine is now producing copper and shipping it, and we wish to submit to our readers estimative calculations which will show them what advantages that company will derive from the establishment of its smelting works, in rendering valuable its unsalable ores; and, in addition to that, we wish to show the profits which the company could make in smelting *all its ore*, as it comes from the mine.

The wood necessary for calcination costs, delivered at Copperopolis, five dollars a cord; charcoal there costs fifteen cents a bushel, or twenty dollars a ton. This is a very high price in comparison with the cost at the Queen of Bronze, and at many other mines situated in wooded countries, yet we will see, further on, that the operation leaves still very fine profits.

Starting with the above figures, and using the methods of calculation of Dr. D'Hierry, which appear to us clear and exact, we find the following cost for six tons of ore reduced to mattes:

CALCINATION.

Wood	$1 20
Labor	2 70—$3 90

SMELTING FOR MATTES.

Charcoal	24 00
Brosque	00 36
Labor	14 52
Utensils	00 60—39 48
Total	$43 38

This total established we can see the profit or the loss which a given amount of ore can produce, the cost of smelting remaining the same whatever may be the value of the ores used.

Six tons of ore, yielding eight per cent. of copper, will produce 2,400 pounds of matte of the value of forty per cent. A good matte of this class will find a purchaser in our market at $3.50 for a unit of copper, which brings the price of the ton to $140, or $168 for the 2,400 pounds of matte produced at the cost of $43.38; leaving thus a profit of $124.12. If we use ore yielding ten per cent., we will obtain 3,000 pounds of matte, which will bring $210 in our own market, leaving a profit of $166.62.

Let us now see the result if the Union would smelt all its ores, rich or poor, just as they came from the mine, and which will yield an average of sixteen per cent. Six tons at this last rate would produce 4,800 pounds of matte, which would be worth $336, and would leave a profit of $292.62. We see that there remains from these different profits a large margin to pay the cost of extraction and of transportation. Mattes do not require bagging—a very important consideration. Will the Union obtain this profit by the shipment of its rich ores to England? We do not think so.

As to the rest, it appears that this company is so well satisfied that it intends to increase its works, not only in order to smelt its own ores, but also to smelt all that may be raised in that district. All right; this may be called understanding an industrial question. Let us follow, now, the reduction of these mattes into black copper, yielding ninety per cent. of fine copper, such as they now produce, in fact, at Copperopolis.

CALCINATION OF A TON OF MATTE.

Wood	$0 30
Labor	0 40—$00 70

SMELTING FOR BLACK COPPER OF A TON OF MATTE.

Charcoal	$1 50
Brosque	0 06
Labor	1 16
Utensils	0 10—$ 2 82
We must add to these figures the cost of the blast, and the re-smelting of some mattes which are always found in the above operation	1 00
Total	$ 4 52

A ton of matte at forty per cent. of copper will have yielded, after this operation, 800 pounds of black copper. We are ignorant what can be obtained in the market for a ton of this black copper, but it may bring as high as about $350.

Starting with these estimates, the six tons of ore, at eight per cent., will yield 1,050 pounds of black copper, which will be sold for $183.75; deducting from this the cost of the two smeltings ($48.80), there is left a profit of $134.95.

The 3,000 pounds of matte obtained from the ores of ten per cent. will produce, at the second smelting, 1,320 pounds of black copper, sold in the market at $231, and which will have cost, at the double smelting, $50.16, leaving a profit of $180.84.

The third example—the smelting of ore of sixteen per cent.—has yielded 4,800 pounds of mattes, which, at the second smelting, will leave 2,112 pounds of black copper, producing, in its sale, $369.56, and will have cost, for the two smeltings, $54.22, which gives a profit of $315.34. Thus, in resuming, we will find that six tons of ore—an average quantity which we can pass in twenty-four hours, in a suitable furnace—give, in profit, in works established under the circumstances of the Union:

Ore of 8 per cent. in matte.	$126 62	in black copper.	$134 95
" 10 "	"	166 62	"	"	180 84
" 16 "	"	292 62	"	"	315 34

We see that if ores completely abandoned, in fact, are capable of yielding fine profits, it is equally advantageous to smelt ores as rich as possible.

As to the weight of ores—of mattes and of black copper—an important question as to freight—this is the *resume*. The weight of ore used was 12,000 pounds:

Ore of 8 per cent. in mattes	lb. 2,400	in black copper	lb. 1,050
" 10 " "	lb 3,000	" "	lb 1,320
" 16 " "	lb 4,800	" "	lb 2,112

It will be noticed, by the preceding, that everything concurs to induce our copper miners to follow the example set by the Union Company: Ore abandoned, made productive; rich ore, made more profitable; the saving of bags, and the saving of from one-half to five-sixths on the freight. But whilst inducing the interested to enter upon this new route, we will remind them always that the reduction of copper pyrites is one of the most difficult and delicate operations of metallurgy, and that this operation requires skilled and experienced men. He who would undertake this reduction, whether to matte or to black copper, however intelligent he may be, if he has not had the necessary experience, would risk compromising seriously, not only the interests of those who would employ him, but also the interests of copper miners generally, in adding a new check to so many others, attributable only to incapacity.

THE DEMAND FOR PETROLEUM.

The consumption of petroleum has enormously increased, as its uses become more and more extended, and the public mind becomes gradually disabused of the fallacy of regarding it as a dangerous burning oil. Petroleum as a fuel has also become the subject of much discussion and investigation amongst scientific men, and there seems no reason to doubt but that ere long some means for adapting it to this use will be found. Petroleum spirit, as a substitute for turpentine, is now extensively and generally used in the manufacture of varnish, the mixing of paints, and for most of the purposes for which turpentine used to be essential. Petroleum lubricating oil now finds a regular market for all the purposes of lubrication, and it is a question whether it may not soon displace to some extent the use of linseed oil, so largely used in the manufacture of paints. It has also been successfully experimented on for the purpose of making soap. The British refiners are now making great improvements in their refined oil.

A late number of the London *Times* remarks as follows, upon the recent experiment, made in that city, with a view to employing petroleum as a fuel, for steam purposes:

An elementary course of experiments was commenced last week in the factory department of Woolwich dock-yard, with a view of testing the capacity of petroleum to supersede coal and other fuel on shipboard, and also in propelling steam machinery in factories. The method adopted is totally distinct from that attempted some time ago in the United States of America, and is the patented invention of Mr. B. J. Richardson, an engineer residing at Kensington. He has submitted his plans to the Lords of Admiralty, and has obtained permission to carry out his suggestion for the benefit of Her Majesty's service. The method is exceedingly simple. If the experiment should prove successful, there is no doubt a reconstruction of the navy will be the result, as an enormous economy will be obtained both in the cost of fuel and in the saving of the immense space now occupied by the coal bunkers, to be applied to other purposes.

The plan under trial is simply to burn the petroleum through a porous material, which is placed in an iron chamber, dipped into a water vessel, also of iron. The oil admitted into the chamber soddens the porous material and rises by a sort of capillary attraction. The surface then catches fire and burns rapidly, as long as the oil is supplied. The effect of the flame is so great, that with the small apparatus, which is only two feet superficial area, and affixed to a boiler, the oil, on Saturday, was utilized so as to be equal for steam purposes to five tons of coal. A third advantage is obtained by the employment of the petroleum, namely, that no stokers are needed, and the boilers can be supplied with several fires, one above another. A small grate used in the experiments was placed under a boiler of 17-horse power, and in two hours it raised the steam to ten pounds pressure. The only objection seems to be the fear of explosive qualities, but these, Mr. Richardson states, he is prepared to guard against effectually.

COPPER ORE FROM SONORA.—The John L. Stephens, on her last trip up, brought 180 sacks of first-class copper ore from the La Favorita mine, Sonora.

[Written for the Mining and Scientific Press.]

The Smoky Valley Mines.

MESSRS. EDITORS:—The Spring is once more with us. Our Winter has been a severe one, still there has been but a very few days in which men could not prosecute their labor in the open air. The miners of Smoky Valley have improved the time. The Sterling Company has graded roads, built a ditch for their flume, got their mines in shape to take out pay ore, and are now waiting the arrival of their fine 20-stamp mill from San Francisco. I had the pleasure, a few days since, of walking over their mill grounds with their affable and gentlemanly Superintendent, Mr. T. L. Burton. The grading for the mill is completed. We first arrived at the roasting-room, which is 48 by 88 feet; it is the intention of the Company to build five roasters. The battery-room came next; Mr. B. informed me that he should place four stamps in each battery, and use five batteries. A tramway has been constructed in front of the stamps, on which cars carry the pulp to the roasters, and back to the pans in the amalgamating room, which is large and commodious. The mill will be run by the aid of a Tyler Turbine Wheel. The Company have their wood ranch almost adjoining the mill site. They have a fine stream of never-failing water running diagonally across the grounds, which will be taken by a short pipe to the top of the main building. A fine granite quarry affords material for building, less than one-quarter of a mile from the works. I did not visit the mines, but am informed that a small lot of ore from one of their ledges lately worked at the rate of $240 per ton. The work of development is constantly going ahead.

Four miles north of the Sterling Company's works, Mr. J. V. Robbins has commenced the erection of a mill designed to crush for the Santa Fe mines. Parties, whose names I have not yet learned, have purchased a mill privilege, some four miles north of the Robbins' works, and design building very soon.

The Antiquarian Company are pushing their work day and night. Some ore from this mine lately washed at the rate of $116 per ton. The Company have a mill privilege at the mine, and will, no doubt, have a good mill on it by fall. This Company have expended over $5,000 in developing their mine, and I have never seen a delinquent advertised.

The Everett and Smoky Valley Companies, on the Smoky Valley ledge, are both taking out fine ore. Many other companies are quietly opening their mines, and all appear well satisfied with the prospects. Smoky Valley offers inducements, and has locations for at least 50 large mills, and I think it will support even more than that number in the course of two years. The ledges are large, and with a few exceptions, show well in the croppings. Having plenty of wood and water, ore can be worked here far cheaper than elsewhere. The Camanche, Empire State, City Point and Sherman lodes are being worked by M. A. Sawtelle and others. The ore from these mines is both chloride and sulphuret, and each of them looks well.

For the farmer, Smoky Valley has many fine grain ranches yet unoccupied. From the Smoky Valley District north to San Antonio and Silver Peak south, there are a great number of silver-bearing mines. The range has been but poorly prospected. New locations are being made almost daily. G. B. E.

Clinton, R. R., April 2, 1865.

HENDY'S GANG CIRCULAR SAW MILL.—We understand that one of these machines has recently been put up at Little river, Mendocino county. It is found to work admirably. The first cargo of lumber from this mill arrived here Tuesday last, consigned to Plumber & Prescott. These gentlemen pronounce this the best lumber, for uniformity of sawing, which they have ever seen. The scantling was cut so uniform and clean, that when piled up, it had the appearance of having been planed. One of these mills, it will be recollected, was exhibited at the last Fair of the Mechanics' Institute, where it attracted much attention.

THE Chinese are flocking to Idaho in great numbers. The great scarcity of water and placer diggings in that region will probably send them back again at an early day, relieved of what loose change they may have started with.

OIL, and how to make a fortune out of it, seems to be engrossing the attention of many of the industrious people of the State at the present time.

TESTING THE FIRE ALARM TELEGRAPH.

On Thursday afternoon the Mayor, Board of Supervisors, Chief Engineer of the Fire Department, representatives of the press, and other invited guests, assembled at the City Hall for the purpose of visiting the different fire alarm stations, and witnessing the practical working of the same. Carriages having been provided, the party started about half-past two, and proceeded first to Station No. 8, corner of Powell and Union streets, where the box was opened by Mr. Kennard, the contractor, under whose directions this new arrangement for giving fire alarms has been erected.

The principal thing observable on opening the box was a crank, similar to that attached to a door gong, which Mr. Kennard proceeded to turn slowly about twenty-five times. In a few seconds the clicking of clock-work inside was heard, announcing that the operators at the principal office in the City Hall had received the signal, and almost immediately thereafter the fire bells on Dupont street, on the City Hall, and on Sixth street, near Folsom, struck an alarm—giving nine blows and after a little pause again repeating the same number of blows, denoting that the alarm was sent from signal box No. 9, near which the fire should be—thus, within the space of one minute, notifying the entire Department, and the whole city, in fact, the precise spot, within a few rods, of where the fire might be. Before closing the box at this station a message was sent to the central office, conveying the compliments of the Board of Supervisors to the operators in charge at City Hall. An answer was immediately returned "all right." It may be well here to state that there is an apparatus attached to each station, by which special messages can be sent to the central office, whenever occasion may require. This apparatus was employed in sending the above message.

The process was repeated at several other stations which the committee visited, and at each of which the bells rung out the proper notice, denoting correctly the point from which the alarm proceeded.

There are sixty signal-box stations, the central station making sixty-one, judiciously distributed throughout the city, and ten police stations. The police stations are independent of the fire alarm stations, yet all communicate directly with the central office at the City Hall. The manner of working the police wires is extremely simple, so much so that any person can learn it in a few hours practice. The operator has a dial plate before him, on the circumference of which is printed all the letters of the alphabet, the numerals and three or four signals for noting the end of a word, etc. Against each letter and character is placed a stop, or finger piece, upon pressing which a pointer comes round on the disk and rests, for an instant, at the letter opposite the stop which is pressed upon, and so on till the word is spelled out. This operation is simultaneous, both at the station and principal office, so that while one writes the other may read. Several messages were thus sent back and forth between the police station on Fourth street, and the central office, to show the committee how the thing worked.

In addition to the three alarm bells already mentioned, twenty gongs are also placed in the several engine houses, in the most of which are dormitories for the purpose of waking the firemen when a fire occurs at night. These gongs are also placed in electrical connection with the batteries, and struck at the same instant and same manner as the bells. Gongs can also be put up in the private residences of any firemen who may desire it, and placed in the same electric connection.

The tests made demonstrated, quite conclusively, that the Fire Alarm and Police Telegraph will accomplish all that is claimed of it, and will form a decided improvement on the mode of communicating alarms heretofore employed in this city. Fogs will hereafter present no obstacles, and intervening hills can no longer hide a fire from the vigilant look-out, who will now be transferred from the old watch tower to a snug room on the second floor of the City Hall. The searching eye of the patient watchman will no longer wait for the uncertain glimmer of an incipient fire to make itself known at his distant and lofty eyrie, from whence but one single bell can announce to the denizens of a sleeping city that their houses are invaded by the fire fiend. Hereafter an electric spark, with the speed of thought will carry the intelligence, and in its returning course develop a power which will ring out upon many bells the alarm that is to arouse our sleeping guardians, whose ready hands need but the slightest warning to urge them on to duty and to danger.

By the politeness of Mr. Kennard, we had an opportunity of a thorough examination of the complete system at the central office, where everything is arranged with a neatness and order which reflects the highest credit upon the contractor. There are ten circuits of wires, five of which are signals and five fire alarms. The signal circuits are those which connect with the signal boxes, about twelve of which are in each circuit; the alarm circuits are those which connect with the alarm-bells and gongs in the engine houses. The police telegraph forms one complete circuit, so that the Chief can communicate with one or all the stations at the same time, according as he gives a single or general call. The particular arrangements and nicely adjusted machinery by which all that we have spoken of is so satisfactorily effected, could not possibly be described within the compass of a newspaper article, hence we have confined ourself to a mere description of effects, the causes of which must be studied at another time.

Before closing, however, we would remark that a most effectual check is placed upon any carelessness or lack of attention that might occur among the subordinate officers at the central office. The system includes an ingeniously constructed electrical instrument, attached to a clock, which is made to act as a "tell-tale" upon any remissness in this particular. The rules of the office require that each of the several circuits of wires shall be tested every twenty minutes, day and night. To effect this, a delicate set of instruments has been arranged by which a weak current can be sent through the wires, barely sufficient to prove that "all's right," but not of sufficient power to sound an alarm. This instrument is tested every twenty minutes, and any failure to do so is noted on the "tell-tale clock," to which none but the superintendent has access.

These works have all been prepared and put up under the personal supervision of Mr. J. F. Kennard, who will soon leave on his return to the East. The organization for the central office has been made up as follows by the Board of Supervisors: Chas. A. Stearns, Superintendent; Monroe Greenwood, Charles T. Simmons and John G. Bryant, operators. The Supervisors will probably decide upon its acceptance at their meeting on Monday evening next.

The fire alarm telegraph was first invented by Dr. Wm. B. Channing and Moses G. Farmer, of Boston. The patent right subsequently passed into the hands of J. F. Kennard & Co., of Boston and Philadelphia. The apparatus has been gradually brought to its present degree of perfection at the expense of much time and labor. The proprietors now hold *fifteen* patents to cover the various appliances and fixtures, and one general patent in combination. The first alarm telegraph was put up in the city of Boston, and went into operation on the 28th of April, 1852. It has since been successively and successfully introduced into the following cities, in the order in which they are named: Philadelphia, St. Louis, Baltimore, New Orleans, Charleston, S. C.; Montreal, Canada, Washington and San Francisco—making nine alarms now in operation. It will soon be in operation also in Chicago and Louisville.

Mines and Capital.—More than half the shares of the Gould & Curry are now held in New York. The lectures of Prof. Silliman are creating a renewed interest at the East in California mines, and will doubtless result in greatly increasing the flow of capital thitherward.

[CIRCULAR]

PROSPECTUS OF THE FIRST NATIONAL PETROLEUM COMPANY.

The *six hundred and forty acres* of land owned by this company were located, after a careful and scientific examinntion of the entire petroleum lands in Tulare and Mariposa counties, in the names nf M. T. Brady, H. E. Brady, Jnhn Fay and M. C. Conroy; the two latter are among our best and most reliable citizens. From them it has been deeded to the Trustees of the FIRST NATIONAL PETROLEUM COMPANY, which was formed through the Agency of Wm. H. Tobey & Co., Petroleum Agents, and incorporated under the laws of the State of California.

The large tract of land owned by this company joins that of the well known "Buena Vista Petroleum Company" on the south, and contains within its boundary one of the largest and most remarkable natural flowing wells yet discovered on this coast. As an evidencc of the richness and extent of the petroleum on this ground, we refer the public to the following extract from the report of Professor E. Benoist, one of tho most celebrated French chemists in California, who has visited the land in person, and made u thorough examination of the same. We copy from the Stockton *Independent* of January 4. 1865:

PETROLEUM AND OIL WELLS IN CALIFORNIA.—Seventy cans of petroleum, in a crude state, were shipped to San Francisco on the steamer Cornelia, by Warren & Co., of this city. This is the first shipment from an oil well recently discovered near Buena Vista Lake, Tulare county. E. Benoist, of San Francisco, left that city on November 20th, having been employed by the Trustees of the Buena Vista Petroleum Company, to examine the springs. In his report, which we find published in the Mariposa *Gazette*, he says: "Having visited several places on this coast where oil has been reported as discovered, I became convinced, from general indications, that at last I had found the spot that would surpass all previous prospects, and I beg leave to assure you that I have the fullest confidence in being able to demonstrate that these wells are unsurpassed by anything yet discovered on this coast, and by development will equal if not exceed in quantity and quality the famed wells of Pennsylvania." He feels assured that from the easy flow of the springs at a depth of fifty feet, "a sufficient number of wells could be made at that depth to produce 50,000 gallons per day at a small expense." The engineer states that he has 100 gallons of crude oil *in transitu*, and on his return to San Francisco, will make samples for inspection by any parties who wish to satisfy themselves in regard to its quality.

The above one hundred gallons of crude oil having been received at Prof. Benoist's laboratory, and a large quantity of it refined, the following item, taken from the *Alta* of the 26th of March, 1865, shows the value of the oil taken from this land:

CALIFORNIA KEROSENE — Hitherto it has been a matter of doubt whether a really merchantable article of kerosene or illuminating oil could be produced from petroleum in any of the forms in which it is found on the Pacific coast. Large sums have been spent in endeavoring to produce the article in purity, but with but questionable success, and until within a short time it has been doubted whether it was possible to find petroleum fit for that purpose here. That question exists no longer. We had the pleasure of witnessing experiments last evening, made at the Petroleum, Asphaltum and Coal Agency of W. H. Tobey & Co., Government House building, in the presence of a number of gentlemen connected with the press, and others, which were conclusive on that point. A lamp was filled with Downer's best kerosene, and another with kerosene produced yesterday from crude petroleum from the leads of the Buena Vista Oil Company, in Tulare county, by E. Benoist, proprietor of the chemical laboratory, 643 Third street, and both lighted at once. The flame of each was exactly the same in color, and if any difference in brilliancy of light existed, it was in favor of the California article. The California kerosene being fresh from the distillery, had a trifle more of a yellow tinge than the Eastern article, but the odor was not a particle more pungent and offensive, and neither gave off any perceptible smoke.

This tract is regarded as a very choice piece of oil land, and upon which can be sunk at least fifty wells. The adjacent property is now being extensively tested, with flattering success, and contributes to enhance the value of this land. These 640 acres were carefully selected by an energetic, practical man, then, and still, a resident of the vicinity, at a period when a pick or choice of the best oil territory was to be had, and who will continue to be a very large stockholder in the company, and has determined to devote bis time and energies to the development of the property of this company, which fact is deemed by his associate owners of immense value. He is now on his way with a new set of tools to still further prospect and sink wells on the land.

There have been *ten thousand* UNASSESSABLE shares of the Capital Stock, at the par value of *fifty thousand dollars*, set apart to develop and work the mine, one fourth of which, only, will be put into the market at a time, at such a price as the Trustees of the Company may see fit to place upon it. In this manner the mine will be developed without further expense to the stockholders than the amount first paid for the stock.

In publishing this prospectus, we have thus far confined ourselves exclusively to facts. We will now give a brief calculation founded upon these facts.

Suppose the FIRST NATIONAL PETROLEUM COMPANY, out of all its ventures upon territory known to abound in oil, strikes a single 100-barrel well. The yield of this solitary well at the present price, say of $11 per barrel, will reach in one year the sum of $401,500, or more than 40 per cent. on the whole capital stock. Five wells, yielding thirty barrels each, (and it is quite certain that nothing less than that will be struck on the company's property), will produce $602,250 a year, or more than 60 per cent. on the entire capital stock. But there is a strong probability that wells of the magnitude of 200, 300, 500 or 1,000 barrels may be struck upon some portion of the company's ground—such pieces of good fortune being not unfrequent in the Pennsylvania and West Virginia oil region. It does not take much ciphering to show that in such a case every stockholder in the FIRST NATIONAL PETROLEUM COMPANY would realize a fortune, large or small, according to his investment.

With these suggestions the company leaves its case in the hands of a discerning public, merely remarking, in addition, that it is designed to develop fully and practically the means and wealth of this property at the earliest practicable moment. That we have extraordinary indications, no one denies, and the area is certainly as extensive as could be desired. Many companies at the East have several wells on one acre only. The First National Petrolcum Company *has territory sufficient to sink one hundred wells*, allowing six acres and over to each well.

We would again call the reader's attention to the fact that after you have purchased stock in this company there are no assessments—no "freezing out," as all the stock is unassessable, and no stockholder is at auy expense whutever; at the same time, his land is being developed.

The prospectus and map of this company will be furnished free, on application at the office of the company. Copies will also be sent by mail, when requested.

A MOUNTAIN OF SALT.—On the south side of the island of St. Domingo is the most singular salt deposit to be found in tbe world. From an intelligent gentleman recently there, and a document issued by a New York company, we learn that there is a mountain of salt six miles long, from one-half to a mile wide, and from four to five hundred feet high. In some places where the sides of the mountain are nearly perpendicular, large cliffs of salt are exposed to view, while in other parts a coating of earth, from ten to thirty feet deep covers the salt. This salt, in its crude state, contains 96.79 per cent. pure salt, while the purest found elsewhere is but 96.75. By the skill and energy of Dr. Hatch, of Massachusetts, grants have been obtained of the Spanish Government, and tbe way is being opened for hriuging this immense treasure to the markets of the world. A railroad, some twenty miles in length, is to be constructed, which will bring the salt to tbe little port of Barahona. Whatever in our world can be kept from spoiling by salt, here is enough of it to make the pickle as large and as strong as can be demanded, and the thing will be fully and speedily developed by Yankee enterprise.

AN ORIENTAL LECTURER.—Mong Shaw Loo, a native of Birmah, and a graduate of the University of Lewisburg, in Pennsylvania, is now delivering lectures in tbat State, on the oil wells of Birmah, and the processes in use there to secure the oil, of which they have made great use for tbe last two thonsand years, or more.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco wbich is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having tbeir Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal, Railroad and Financial Advertiser, New York.*

Postponements and Alterations.—Secretaries are requested to give notice of postpouements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—Nos. 11 and 56 Government House, corner Washington and Sansome streets, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor. *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and their opinion will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and save vexatious specifications. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee required, by law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is issued, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in tha United States upon the same terms as our own citizens. The only discrimination now against subjects of Government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons assigned by the Examiner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, rooms 56 and 57, Government House, corner of Sansome and Washington Streets, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instructions, etc. Our charge for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicos, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every caveat.....	10
On every application for a patent.....	15
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for reissue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, Government House, corner Sansome and Washington streets, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to tha size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

The Grass Valley Catholic Orphan Asylum, now in process of erection in that town, is to be a three-story building, of wood. The basement is to be used for kitchen, dining room and such purposes. On the second story will be a school room, chapel and the apartments of the Sisters. The third floor will be used as sleeping quarters for the orphans. The building is to be completed by the 1st of August.

The white fish of our great lakes have attracted attention abroad, and it is proposed to introduce them into the lakes of Cumberland and Scotland, now almost valueless.

Fremont's Interest in Mariposa.—A great many contradictory reports have been circulated with regard to Fremont's interest in the Mariposa mines—some asserting that he had lost it altogether. At a recent trial in New York, he himself explained that 33,500 shares are still his, out of the original 100,000.

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY,

STEAM ENGINES AND QUARTZ MILLS,

DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S

NEW GRINDER AND AMALGAMATOR,

HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,

Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies.

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. Belden, W. T. Garratt, H. P. Wakelee,
O. Cori, Geo. Johnson, C. M. Radcliff.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

REMOVAL.

The Office of the

Rose Gold Mining Company

Has been removed to No. 338 Montgomery street. Athenæum Building (Room No. 12), southeast corner Montgomery and California streets. [9v10-4t] C. M. PEOK, Secretary.

We clip the following notice from the *Mercantile Gazette and Prices Current* of the 12th instant, from which it will be observed that that paper is no longer responsible for the Commercial and Financial reports of the *Bulletin*:

Notice.—It is well known to the patrons of this paper that its Commercial and Financial reports have hitherto been, in a great measure, identical with those of the *Evening Bulletin*. It is due the latter to state that the peculiar relations of which this was the result, ceased with our last issue.

Returning.—It is said that a large portion of the passengers who went East on the last steamer were former citizens of the Southern States, who now return, hoping that the war is over, and that they will be allowed to return quietly to their former homes.

The seal of the rebel States of America is described by the English newspapers. It is designed by Foley, the celebrated Irish sculptor, and contains in the center a representation of Crawford's statue of Washington. This is surrounded by a wreath, composed of the most valuable vegetable products of the Southern soil—tobacco, rice, Indian corn, cotton, wheat, and sugar cane. The rim bears the legend, "The Confederate States of America, 22d of February, 1862, *deo vindice*." The seal is of silver, and its diameter is four inches.

BLASTNG

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.

Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10q

Awarded to

23v9 V. SQUARZA.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the Mining and Scientific Press. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

Inventors and Inventions.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

TO MINERS AND MECHANICS.

The publishers of this paper are making great efforts to establish, for the benefit of miners and mechanics, a journal which shall occupy on the Pacific coast a similar position to that filled by the *Scientific American* and the *American Artisan* in the Atlantic States. Our isolated position and peculiar necessities appear to require a journal quite distinct, in many particulars, from similar publications at the East. To meet this want we have established the MINING AND SCIENTIFIC PRESS. Here the miner, the mechanic, and the man of science, find themselves brought in closer contact and more dependant, each upon the other, than in any other locality on the globe. Hence we have endeavored to present this paper to this community of interest as a representative journal. In order to carry out the plan of our work as it should be done, we greatly need the assistance and co-operation of those for whose benefit it has been established. Every miner, every mechanic and many men of science to whose attention this paper is submitted, or who may, as a regular subscriber or by casual circumstance, hold this paper in his hand, should show it to his friends—the miner to his fellow-miners and the mechanic to his fellow-mechanics—and do what he can to induce them to join him in the support of a journal whose measure of usefulness will be in proportion to the liberality with which it is supported. The press, throughout the State, and the public everywhere, so far as we are informed, recognizes the value and importance of the MINING AND SCIENTIFIC PRESS to the great interests in California, to whose advancement it is pledged. It has now reached its tenth volume, and is established on a firm basis. Its publishers are desirous of still further improving its appearance and usefulness. Hence this appeal to its friends. The paper has just entered upon a new volume and the present affords a most favorable opportunity to commence your subscription. Numbers have already come in, since the commencement of the new volume, and we hope to add many more to our list ere we reach the close of another quarter. No better investment of money can possibly be made by the miner or the mechanic. The information contained in one volume of this paper is of many times more value than the cost of subscription—and worth far more than the information which the same amount of money will purchase in books.

Blanks.—We furnish Secretaries gratuitously with correct blanks for advertising assessment notices, delinquent sales, postponements, etc.

Machinery.

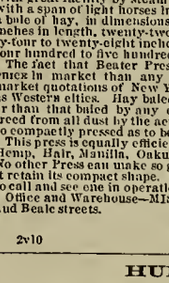
Pacific BEATER PRESS Company.

SAN FRANCISCO, CALIFORNIA.

This Company are prepared to manufacture and sell the celebrated PORTABLE BEATER PRESS, so well known in the East, where it has, in the short space of two years, almost entirely superseded all other

HAY AND COTTON PRESSES.

This Press is easily moved from place to place, requiring only two span of horses over any ordinary road; is worked with great facility by steam or water power; and two men with a span of light horses in ten minutes time will turn out a bale of hay, in dimensions measuring three feet eleven inches in length, twenty-two inches width, and from twenty-four to twenty-eight inches in depth, and weighing from four hundred to five hundred pounds.



The fact that Beater Pressed hay commands a preference in market than any other, is substantiated by the market quotations of New York and other Atlantic as well as Western cities. Hay baled with this press is much cleaner than that baled by any other in use, being completely freed from all dust by the action of the beater, besides being so compactly pressed as to be fire and water proof.

This press is equally efficient for Cotton, Wool, Pulu, Tow, Hemp, Hair, Manilla, Oakum, Hops, Rags, Shavings, &c. No other Press can make so good a bale of cotton, and make it retain its compact shape. Parties interested are invited to call and see one in operation.

Office and Warehouse—MISSION STREET, between Main and Beale streets.

W. H. MITCHELL,
2v10 **General Agent.**

HUNT'S IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

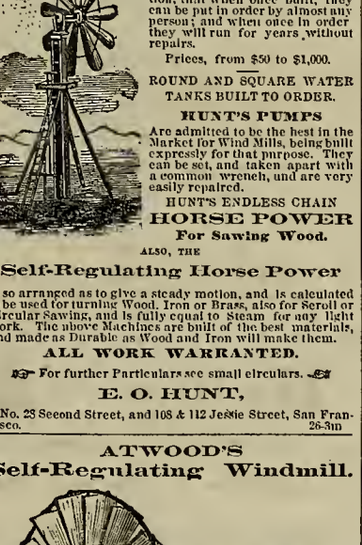
Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.
ALSO, THE
Self-Regulating Horse Power



Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,
No. 23 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S NEW DITCHER.

HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,
Windmill Builder, No. 23 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

Hansbrow's MINING PUMP.

Six-Inch Cylinder—Eighteen-inch Stroke—Four-Inch Suction—Three-Inch Discharge—Capable of Forcing Two Hundred Feet high with ease: Also—

HANSBROW'S FIVE-INCH DOUBLE CYLINDER,

A Powerful Hand Pump, throwing a two and a half inch stream; Also—

Hansbrow's Deep Well and Windmill Pump.

All Sizes for sale by

LOCKE & MONTAGUE,
Nos. 112 & 114 Battery Street. 2v10

SALMON'S PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada territories, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this Amalgamator, and assayed by Miller & Lunbaum, of Austin, Nevada:

No.	Fine		No.	Fine
Assay.....250	943	Assay 300		990
Assay.....285	941	Assay for Czotman		980
Assay.....286	940	Assay Water Rock		966
Assay.....291	950	Assay Water Rock		998
Assay.....		.....St. Helena Lodge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,
To whom all orders should be addressed. 15

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**
1v10 San Francisco.

THE NOVELTY.

This ROTARY CYLINDER GRINDER & AMALGAMATOR *did not receive* the premium at the Industrial Exhibition. The one there displayed worked one hundred pounds at a charge, and was classed merely as a model, honorable mention of which being made by the committee. The inventor is now manufacturing some of the larger size of this machine, capable of working Two Thousand Pounds at a charge, and requiring no more power than is necessary for the pans now in use working but one-third that amount. This machine is simple in construction, durable and compact, very easy to clean up, and, in fact, is a perfect machine.

In offering his Amalgamator to the mining public the Inventor does not claim to have found the "Philosopher's Stone," nor any new method of extracting the precious metals from the ores, but does claim, as a practical mechanic and worker on mining machinery, that there was room for improvement in that direction, and that he has, by careful study, invented his improved ROTARY CYLINDER GRINDER AND AMALGAMATOR, known as the "NOVELTY," which mechanically overcomes the many difficulties that have heretofore arisen in the art of amalgamating ores.

This invention consists of a cylindrical-shaped case placed horizontally on legs, and provided with dies one and a half inches thick, making seventeen square feet of grinding surface, and having a rotary oblique muller (one or more) placed within it, and covered with shoes one and a half inches thick, and so constructed that all particles of rock must pass between the shoes and dies, causing it to be thoroughly reduced. The process of amalgamation is similar to that of the German Barrel, but much more rapid than that or any other amalgamator, as the muller gives three distinct motions to the pulp in one revolution. Heretofore, the chief objection to cylinder amalgamators has been the great wear and friction to which the journals were subject; but in this amalgamator that difficulty has been entirely overcome by the use of an adjustable metallic box, a new invention, that acts for the double purpose of a metallic packing and a journal box, and works to perfection.

This machine, when seen working will convince any practical man of its superiority over all others, and the public in general, and Miners and Millmen in particular, are invited to call and examine these machines, now in operation at the Miners' Foundry, where they are now being manufactured. Address, Miners' Foundry, San Francisco, Cal.

H. L. HOPKINS,
7v10 Inventor and Patentee.

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

PRATER'S PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNGERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8-tf

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

Hepburn & Peterson's AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crescent-Jaw Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer.

A Nevada Invention.—The Scientific American reports the patenting of an invention of W. F. Stewart, of Austin, of an improved mode of working silver ores and saving amalgam and quicksilver. Frank Stewart resided temporarily in this city about a year ago, and often mentioned that he had a process by which all amalgam and quicksilver that was then wasted could be saved. He never vouchsafed us an explanation; but we inferred that it was a chemical preparation. At that time there was great loss at the mills complained of by the miners, which, we think, does not occur to-day, although ores of the class worked then are worked now by nearly the same process, but cheaper. There is still some loss of quicksilver, and, without doubt, amalgam, which, probably, this invention may save; if so, and it can be done cheaply, Stewart can make the fortune we really wish him to possess. His residence, however, is San Jose, Cal., and not Austin. We think he would have brought his invention into notice much sooner by doing his patenting business through the office of the Mining and Scientific Press of San Francisco, rather than the Scientific American of New York. For that, he deserves a newspaper lick from some one. The Mining and Scientific Press is a paper that all citizens of the Pacific coast should be proud of, and those connected with mining particularly should give it their support. As a mining journal and instructor, it is far preferable to the Scientific American, although that paper leads all others in its specialty of mechanical engineering.—[Reese River Reveille.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew

TO CAPITALISTS.

A Rare Chance for Profitable Investment.

The writer is in possession of a COPPER CLAIM, of 1,500 feet, located in Rough & Ready District, Tuolumne county, on which a shaft has been sunk to the depth of sixty feet, which is well timbered, curbed and covered, with everything necessary to the immediate prosecution of work. Also, a DWELLING HOUSE. The lode is regular and well defined, a great part of the ore from which would be classed as second quality, or No. 2. Both Thomas and J. Hardy own in it, and could be consulted as to its merits before visiting by any parties desiring to do so. I wish either to sell or get it worked on shares, and will offer superior inducements to any one desiring to invest. Apply at

11v10 San Francisco.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk.

By O. C. Lyncher, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v19-3m

UNASSESSABLE.

First National PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. R. EWER, M. G. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking upon shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 543 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTIFIC PRESS.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly files all necessary papers as Claim Agents.

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be sent in as early as possible.

Consolidated Silver Hill Mining Company
Office, No. 522 Montgomery street, San Francisco.

The regular Annual Meeting of the stockholders of this Company will be held at the office of the Company, on Monday, May 1st, 1865, at 4 o'clock P. M. By order of the President. JOHN S. MACKENZIE, Secretary.
San Francisco, March 31, 1865. apr1 4t

Chihuahua and Western Summit Mining Company, Esmeralda District, State of Nevada.

Notice is hereby given, that a Stockholders' Meeting of this Company will be held at the Company's office, No. 436 Jackson street, San Francisco, on Monday, May 1st, 1865, at 11 o'clock A. M., for the purpose of electing officers for the ensuing year. W. L. BROMLEY, Secretary,
No. 436 Jackson street.
San Francisco, March 31, 1865.

Comstock Gold, Silver and Copper Mining Company, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of March, 1865, an assessment of $2.50 per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at room No. 9 Mercantile Library Building, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 13th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

CHAS. H. PLATT, Secretary.
Office, Room No. 9 Mercantile Library Building, N. E. corner Bush and Montgomery street, San Francisco.

N. B.—The above assessment is levied for the months of March and April—one-half the amount ($1.25) payable immediately, and the balance on or before the 29th day of April next. (mar25) CHAS. H. PLATT, Secretary.

Cuba Gold and Silver Mining Company, Location of Mine and Works, Humboldt District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1865, an assessment of one dollar per share, in U. S. gold coin, was duly levied upon the capital stock of said company, payable immediately to the Secretary, at the office of the Company, No. 606 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the sixth day of May, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

EDWARD FLANAGAN, Secretary.
Office, No. 606 Montgomery street, San Francisco.

L. J. WILSON, Superintendent, at the mine, Humboldt City, is authorized to receive and receipt for assessments.
mar25-4t E. FLANAGAN, Secretary.

Daniel Webster Gold and Silver Mining Company, Sacramento District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of March, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 29th day of March, 1865, in United States gold coin, to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 17th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary.
Office, No. 204 Front street, San Francisco. apr1-5t

apr8 Office, 328 Montgomery street, San Francisco.

Real del Monte Consolidated Gold and Silver Mining Company—Office, No. 522 Montgomery street.

The regular Annual Meeting of the Stockholders of this Company will be held at the office of the Company on Monday, May 1st, 1865, at 10 o'clock A. M. By order of the President. W. P. WILLARD, Secretary.

San Francisco, March 31, 1865. apr1-4t

Silver Creek Mining Company, Keyes Mining District, Mono County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of March, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 416 Washington street, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 13th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. F. MILLER, Secretary.

Office, No. 416 Washington street, San Francisco. apr1

Santa Cruz Petroleum Oil Works Company—Location: Santa Cruz County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 22d day of February, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

STILL PROGRESSING!

REMOVAL.

THE OFFICE OF THE

Mining and Scientific Press

Has been removed to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a

JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices, without insult or impunity, by the Proprietors.

E. D. WATERS, JR., C. W. M. SMITH, } Proprietors. { A. T. DEWEY, W. B. EWER.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritons, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

v9-19 SAN FRANCISCO.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A DAY OF MOURNING.

There are times when words utterly fail to express our emotions. Such a time is now upon us. But yesterday we were singing peans to our country's victories, while deep-voiced cannon thundered forth a glorious hallelujah through the air. To-day we are clothed in sackcloth and ashes, and a bereaved nation mourns over the loss of one good and great beyond all others of his race. Abraham Lincoln is no more of earth! The banner of our country, which but yesterday waved so proudly in triumph over glorious victory, droops mournfully to-day, wrapped in the sombre drapery of sorrow! A great nation, like a strong man, stricken down in his strength, mourns as we mourn only when the beloved head of the household is taken away. Funeral crape is in all our homes. Our places of business, our temples of justice and the sacred altars of our religion are clothed in the same funeral emblems. The loved, the honored, the revered head of the nation has been stricken down, and how? The red hand of treason, driven from the open field of fair combat, has stolen its covert way into the bosom of an unarmed family, and in the person of a black-hearted assassin has committed the foul deed at which millions stand aghast, and which finds no parallel save that which nailed to the accursed tree the Savior of mankind!

A new sacrifice has indeed been made; one which perhaps was needed to atone for the dark iniquity which has so long brooded over our beloved land. But woe to him and them through whom the offense has come! Will not the righteous God turn the foul deed into the heaviest blow which treason ever yet has felt? Aye, let the offenders bumble themselves in the very dust, confess and repent of their wickedness and pray God to avert the wrath of a people justly roused to vengeance by such a fearful wrong.

Whether directly engaged in the foul conspiracy or not, no man North or South, who has ever raised his arm in treasonable conflict, or his voice in even distant sympathy therewith, can say "I did it not;" for inasmuch as every sinner crucifieth Christ afresh by his sin, so every traitor who has struck a blow and every one who has expressed the most distant sympathy with this accursed rebellion, points the dagger and buries the lead anew in the body of him who alone stood between the traitor and retributive justice.

The time and manner of the death of our beloved President has secured to him an immortality of fame, while it has affixed to this rebellion a seal of reprobation by which it will stand accursed through all coming time as the foulest page in the world's political history. Mr. Lincoln died without a pang, in the moment of victory, and just as he, in the noble kindness of a great and generous heart, was waving the privilege of triumph, and seeking to restore a good and kindly feeling to our distracted nation, by ignoring the victor's right, and extending to his rebellious countrymen the largest measure of leniency which he believed his powerful influence could secure from an outraged people. In this it is, that consists the deep damnation of his taking off. And thus have the traitors slain their best friend, whose only fault was too great a leniency, prompted by a heart overflowing with kindness, and one which would have been merciful, even at the expense of justice. Who now can stand between the rebel leaders and the hangman's rope?

May we not believe that there was a Providence which shaped the event? Do we not discern through the darkness of to-day—so terribly dark—a brightly fringed cloud, giving hopeful promise that our woe is not all for naught?—that the terrible sacrifice which our country has been called upon to make, has not been all in vain? Was it not through just such a sacrifice only that our nation was to be saved from a temporal death, as a nobler sacrifice was needed to save the world from moral death? The sacrifice has been made—it is finished. The lingering tenderness which so many felt but yesterday for the dark iniquity embodied in the slaveholders' rebellion, is wiped out forever. What loyal heart is there which does not feel the change? That which might have been spoken yesterday with impunity, to-day may be punished with instant death, and all the people would say, Amen!

"A Chiel Amang us, Takin' Notes."—We believe it is not generally known that Dr. C. T. Jackson, the distinguished chemist and mineralogist, from Massachusetts, is now in Washoe "taking notes" of the mines. We presume that he visits the Pacific coast in the interest of Eastern capitalists, who are now turning a large share of their attention to the development of the mines situated in the Great Salt Lake Basin and its northern and eastern border. The report of Dr. Jackson will be of more importance to California than that of any learned man who has visited our shores since the discovery of gold on this coast. The Doctor is well and favorably known by most of the learned men in Europe, as well as in our own country, and his reports will have great weight with such men in their estimate of the resources of the Pacific coast.

English and American Railroad Speed.—Owing to the superior solidity of construction adopted in the building of railways in England, a greater degree of speed is attainable there than on the lightly constructed railways of America. The night mail train from London to Perth, in Scotland, runs at an average speed of forty miles per hour, including stoppages; while the mail train from Washington to New York makes only about twenty-five miles per hour.

Important Patent Law Amendment.—An amendment to the Patent Laws was passed just previous to the adjournment of Congress, which provides that any person having an interest in an invention, whether as an inventor or assignee, for which a patent was ordered to issue, upon payment of the usual fee of twenty dollars, but who has failed to make payment, as provided in the Act of March 3, 1863, *shall have the right to renew his application* for a patent for his invention, provided such application be made within two years after the date of the allowance of the original application. This amendment will afford relief to a large number of inventors, who have failed to pay the twenty dollars within the heretofore prescribed six months.

Map of Lower California.—We have received, from the publisher, A. Gensoul, 511 Montgomery street, a neatly executed map of the mineral districts in Lower California, known as the San Antonio, Los Cacachilos and Carmen Island. The map has been prepared with great care by Don Gustavus Cox, M. E. The precise locality and relative position of about 130 different mines are given on the map, with the boundaries of each closely defined. The map has been prepared from accurate surveys, and will be found of especial value and interest to all persons interested in the mines of that section.

The Seaver Ranch.—We understand that the arrangements for completing the purchase of this ranch, situated one mile from the town of San Pablo, are mostly arranged. The price fixed upon is $25,000. We are furthermore informed that Messrs. Kirk & Little, gentlemen who have had large experience in oil boring at the East, have so much confidence in the ground that they are ready to enter into a contract to furnish tools and sink for oil on condition that they are to receive no compensation until they strike a flowing well, provided, that when that end is attained they shall have ten dollars per day for the time and labor expended in sinking.

Acknowledgment.—We are under many obligations to Senator Conness for a large number of valuable public documents, among which we notice the "Eighth Census Report," the "Report of Progress on the Coast Survey for 1862," with accompanying maps, the volumes of the "Congressional Globe for the First Session of the Eighth Congress," a "Biographical Dictionary of the Past and Present Members of Congress," etc., etc.

Copper Smelting in Copperopolis.—We understand that the most complete success still attends the copper smelting enterprise in Copperopolis, so much so that the company intend to commence, immediately, the erection of some ten or twelve additional furnaces.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

The Origin of Salt and Lime.

Editors Press:—I was pleased to perceive in your last number an article on "a mountain of salt," which aids me somewhat in the elucidation of views which I have sometimes entertained with regard to the possible origin of salt. Geologists attempt to account for its origin, I think, by supposing that it is the result of the evaporation of water upon the earth's surface, which they conclude results in this residual salt, which has accumulated for countless ages. Lime, they also suppose, has its origin in the salt water of the ocean, and they partially recognize it in their systems of philosophy and *geo-logos*, as belonging to the sedimentary rocks alone. Crystalline limestone or marble they endeavor to account for upon the hypothesis that it is a metamorphism of common limestone of the sedimentary measures; whereas the primitive limestone or marble is found associated with the primitive rocks—granite and hornblendic and talcose slate, and the metal copper, miles away from any sedimentary rocks; and the marble maintains the same position relative to the metal and primitive rocks that greenstone trap does at other points on the earth's surface.

This marble is found in El Dorado and Placer counties, repeatedly maintaining this relation to the metal, copper and the primitive rocks mentioned, as may be seen at the Home Copper Mine, at Alabaster Cave, near Auburn, and the Nyman and Excelsior mine in the same neighborhood. A beautiful illustration is to be seen at the Tullis mine, near Volcano, one of the very finest mines—peacock ore—in the State.

We find marble in the Green Mountains of Vermont. Humboldt, in his "Equatorial Regions," mentions primitive limestone! Livingston, in his travels in the mountains of Africa, speaks of it. It is also found in the Appenines, and Lyell and others speculate with regard to its possible sedimentary origin, as though they did not apprehend or admit the possibility that it could be other than a derivative rock. I suspect that our geology needs modifying in this particular, and therefore I throw out these suggestions inviting examination and discussion. We want facts, and to know where they are to be found, and to have them fully described, and from *those facts* we must draw our inferences. By inference I have had for a long time serious doubts with regard to the generally accepted theory of the origin of salt, whether it is a derivative or an igneous product. Here we have "a mountain of salt" as described in your last number. We have the salt mines of Cracow, in Poland, which have been worked for centuries—mined out with powder as we quarry marble.

There is salt in the mountains of Tennessee and Northern Alabama, and immense amounts of salt in Nevada, near Reese River district, and in such quantities as described by the press of that State and by the correspondence of travelers, as to lend one to doubt very seriously whether it is a mere superficial deposit—extensive as it is apparently.

If, as I suppose, the salt of that great deposit is of igneous origin, then the country rocks both east and west of it will be found extending in a northerly and southerly direction, in accordance with some electric law which seems to regulate the course of the rocks on this Pacific coast. Probably the course is true north or 15 deg. 40 min. west of magnetic north. Will not some of your correspondents in that vicinity send you some facts, possibly samples of bed rock from just below the surface?

A few pounds sent by private hands would cost nothing, and would aid in the solution of this problem. Let them describe the topography of the country. Is the salt found only in the lowest places? Have excavations been made at any point which show that it is confined between continuous walls, and if so, the course it seems to follow? Are there other deposits, on the same line essentially, northerly or southerly, or easterly or westerly? Let them send facts of all kinds as near as they can describe them.

O. W. Easton.

A great English dictionary is now in preparation in England, under the auspices of the Philological Society. It will include every modification of English, as well as Provincial, Scottish, Irish, American, Canadian, Australian, East Indian, etc.

[Written for the Mining and Scientific Press.]

Copper Mines near Latrobe.

The continuation of the Copperopolis system of veins of copper crosses the Cosumnes river near Michigan Bar, and has been located upon at intervals in a course north by about fifteen degrees west, to the American river. The location on these lodes, north of the Cosumnes river, was made early in January, 1863, on Bryant's ranch, about one mile east of Latrobe, and soon after was incorporated as the Cosumnes Grove Copper Mining Company. Their ground, 5,000 feet, is well prospected by several shafts of from seventy to eighty feet in depth, with such results as to induce the company to go on with permanent work, a large proportion of the stock being in the hands of original locators. Next north, on the same lode, are those small segregated claims, of 400 feet each, owned by separate individuals, on which, at a depth of six feet, is found a bed of yellow sulphurets of copper, about ten feet wide, which assay, so near the surface of the earth, eleven per cent. copper. Next north is the claim of Douglas & Nyman, of 1,000 feet. Work on this claim is vigorously prosecuted. The owners not being present, I could obtain no reliable information, but was informed that at a depth of about 140 feet they have a vein of sulphurets three feet wide.

Still north, on the same vein, is the Buckeye or "Agra Company," beyond which, a distance of two or three miles (several shafts of more or less promise intervening), is the mine of the Boston Company, controlled by Bigelow Bros., of San Francisco. This is being worked with persevering vigor, and has ore of great promise, and in quantity such as in all probability will enable the company to soon become a dividend-paying concern. Next north comes the Midnight, equal in richness to the Boston; then the Chaparral and the Constitution, which last crosses the Placerville road about one and a-half miles east of Clarksville. This is a mine of great promise. The lode is known as the Cosumnes Grove lode, and is undoubtedly a master lode; it is so pronounced by all who have examined it. These locations are all of easy access, none being more than six or seven miles from the railroad. In fact, the railroad passes within forty rods of all the shafts of the first-named companies, up to and including that of the Agra Company.

Another vein of great promise, about one-half mile west of the Grove lode, is attracting much attention. The first location on this lode was made in March, 1863, of 5,400 feet, and incorporated as the Tear and Rip Copper Mining Company. With even so hideous a name, this mine is doubtless to be of great value. The shaft is 100 feet deep, and I was informed that at a depth of forty feet it had a six foot vein, and twenty per cent. copper.

The work has been stopped, and the company does not seem to be very harmonious; in fact, the stockholders openly charge mismanagement. I will say, the evident waste of money on this mine may be the result of ignorance; for a proposition was made in my presence to work the mine on the condition of making it yield $100 per day, or no expense to the company. From the masses of ore in sight, I think it little risk to hazard the opinion that this is destined to vie with the far-famed Union of Copperopolis. I was pleased to hear that parties from San Francisco are in treaty for its purchase. Next north of the Tear and Rip is the ground of the Return Company, 2,500 feet, incorporated and held exclusively by original locators, some of whom are prominent men of San Francisco. This company have fine improvements, a shaft eighty feet deep, about 100 feet from the Tear and Rip, with the same ore. It has very evidently been closely held by shrewd business men. Next north, on this vein, are the works of the Mistletoe and Cumanche; the latter has been worked very handsomely, and will soon be known as a dividend-paying company.

The limits of this letter will hardly admit of a more extended notice of this interesting region. In closing, I cannot refrain from an expression of surprise that so little is known of these mines. Ten, or at most, twelve hours by steamer and cars from Montgomery street, and we have here mines, that with but moderate capital, can in a very short time be made to satisfy the most avaricious. I feel that I am justified in saying thus much, and in closing, will simply advise all who desire such interest, to examine the districts referred to. L.

Latrobe, April 16, 1865.

Cheap Gas.—In England they expect to make gas so cheap that poor folks will, as a matter of economy, light, warm and cook by gas.

Iron Smelting in India.

In ancient times iron was always directly extracted from the ore in the form of malleable iron; and the process of direct extraction is still pursued amongst the natives of India, Borneo and Africa. The apparatus employed is of the simplest character, consisting merely of a small furnace and blower. The richest ores are employed, and the fuel is invariably charcoal. A mass of malleable iron is directly obtained, which is first hammered into a bloom and afterwards extended under the hammers into bars. From the large accumulations of slag in the various parts of India, it is inferred that iron smelting by the direct process has been pursued from the earliest times, and judging from the rude and diminutive appliances at the present day, there has evidently been no improvement upon the original methods. The furnaces are often no longer than a chimney pot, and the smelters like itinerant tinkers, carry them about from place to place, where ore is abundant, or where there happens to be a local demand for iron. Nothing can exhibit the great difference between their simple methods and the extensive operations among civilized nations, than this fact. The bellows by which the blast is produced is made of the skin of a goat, taken off the animal by opening the hind part only; the holes corresponding to the legs are sewn up; at the neck-end is inserted a nozzle of bamboo, and the tail-end is cut transversely, so as to form, when the edges are brought together, a long straight slit for the admission of air. For a considerable length, but not the whole extent, of each of the edges or lips composing this slit, a piece of split bamboo is firmly tied on the exterior. By this means the slit may be readily closed or opened and made to act the part of a valve. The skin is made very supple by rubbing it with oil. Each furnace is provided with two such blowers. One man is required to work them, and he sits cross-legged on the ground between them, moving them alternately to keep up a continuous and regular blast. A leather thong passes from one of the lips of the valve round his hand, and to fill the bellows, he drops the lower lip and raises the upper one, when air enters, swelling out the skin into the shape of a conical bag. He then quickly catches up the lower lip, closes the valve, and bears on the inflated skin, forcing out the contained air through the nozzle into the furnace. A large blower is made of buffalo hide, requiring one man to work it. The tools used are much the same in all the Indian furnaces, though the furnaces themselves are of different construction. The anvil is of wrought iron, small and square, and without a beak, to supply the place of which a separate tool is used. The hammer, tongs, etc., are pretty much the same as those used in advanced countries. Hard woods, such as teak and babool (*Acacia Arabica*) are preferred for charcoal. Sometimes wood called sal (*Shorea Robusta*) is preferred where obtainable; but where there is no choice, any wood is used, and sometimes bamboo. The charcoal is used in pieces about the size of walnuts, the dust being sifted out. The ore is brown hematites, and it is broken into pieces not larger than peas, and the fine dust produced in the operation of crushing it carefully sifted and thrown aside.

The furnace in use among the Hill Tribes of the Ghats, is only two feet high, and yields five or six pounds of iron at a charge; but in the Deccan it is often four feet high, and produces thirty pounds of iron at a charge. It is circular in form; its width at the bottom or across the hearth is from ten to fifteen inches, and at the top from five to twelve inches, and as already stated, its hight ranges from two to four feet. It is built entirely of clay, carefully tempered. There are two openings in the bottom of the furnace, through one of which the blast is admitted, and through the other the slag or cinder and the iron produced are removed.

The operation of smelting is conducted in the following manner: Two earthen pipes or twyers, about twelve inches long and one inch in internal diameter, are placed side by side in the opening at the front of the furnace, so as to project two or three inches into the interior of the furnace, and be three or four inches above the bottom, and with each of these twyers a bellows is connected. The remainder of the opening is then filled with clay. The furnace is now filled nearly half full of charcoal, and upon this fire is put, after which it is filled up to the top with charcoal. The blast is then applied. The smelters attach a good deal of importance to the kindling of the fire at a proper hight above the twyer, and as it extends downwards very slowly, a small quantity of charcoal remains unburnt in the bottom of the furnace until almost the end of the operation. When the charcoal sinks, alternate charges of ore and charcoal are supplied, until the proper charge of ore has been introduced, after which the blast is increased to its full capacity, and thus maintained until the close of the operation. Cinder soon appears in the hearth, and when it rises to the twyers, is tapped off by inserting a small bar through the forepart of the furnace. A large portion of cinder, however, remains and is taken out with the iron. A charge is completed in from four to six hours; the front of the furnace is then removed, and a small mass of malleable iron, cinder and unburnt charcoal, is drawn out. If the operation has been properly conducted, the iron is sufficiently hot to be hammered at once into a tolerable sound bloom, with the extrusion of a thick viscid cinder; if the iron is too cold, as often happens, it has to be re-heated over an open charcoal fire. In different localities there are modifications of the apparatus, but they are all of the simplest character; but it is asserted that the iron produced is superior to the best of the English manufacturers. An authority upon the subject asserts that some of it could be drawn out under the hammer into a fine nail rod not one-tenth of an inch thick, without splitting, and could be bent backwards and forwards six or seven times without breaking. It could be twisted to a considerable extent without fracture, and a half inch bar one-quarter inch thick, bore doubling together *cold* and hammering down close to the angle with very little appearance of separation between the fibres. The whole cost of production of bar iron is estimated at eighty or ninety rupees (eight or ten pounds sterling) per ton.

The natives of Borneo have the reputation of producing the best iron and steel by direct process. In *Schwaner's Travels in Borneo*, 1843–1847, may be found a description of the process. The celebrated but unfortunate traveler, Mungo Park, bears testimony to the production of iron by the direct process by the inhabitants of Africa.

The Shadows of Childhood.—God bless the little children! We like their bright eyes, their happy faces, their rosy cheeks! Nothing seems to weigh down their buoyant spirits long. Misfortune may fall to their lot, but the shadows it casts upon their life-path are fleeting as the clouds that come and go in an April sky. Their future may perchance appear dark to others, but to their fearless gaze it looms up beautiful as the walls of a fairy palace. There is no tear which a mother's hand cannot wipe away, no wound that a mother's kiss cannot heal, no anguish which the sweet murmuring of her soft, low voice cannot soothe. The warm, generous impulses of their nature have not been fettered and cramped by the cold formalities of the world; they have not yet learned to veil a hollow heart with false smiles, or hide the basest purposes with honied words. Neither are they constantly on the alert to search out our faults and foibles with Argus eyes; on the contrary, they exercise the blessed charity which thinks no evil.

Professor Agassiz Going to South America.—In a Lowell Institute lecture, last week, the distinguished superintendent of the museum at Harvard University expressed a wish to visit the Andes, that he might verify some of his theories regarding the glaciers. Nathaniel Thayer, Esq., already a munificent benefactor of the college, was present, and has since proposed to Professor Agassiz to go to South America, offering to pay his expenses and those of as many assistants as he may choose. The Professor gladly availed himself of the offer, and will start soon, probably from New York, taking with him eight young men, students and assistants. He will go direct to Rio Janeiro, and examine the mountain ranges in the southern part of Brazil and in the neighboring provinces. Its further course we have not learned, but we understand that his westward trip may extend as far as the Andes. It is probable that this excursion will cost not less than $20,000.—*Boston Traveller.*

Man and Working Animals.—In man there are but six ounces weight of stomach to one hundred pounds of body, which illustrates in a similar way why our food must be in a concentrated form, and why, although the potato or other vegetables may keep us in good flesh, yet to sustain the energy of the system, particularly for those who do the most labor, the greater concentration of a meat diet is an absolute essential. This fact is illustrated also in our treatment of working animals. Those which are not in actual employment are kept in good condition on bulky food; but when the ox or horse must make up the extra waste arising from labor before the plow or on the road, and be kept in spirits for the work, he requires nutriment in the more concentrated form of grain, which goes to support the muscular system.

Railroad Gauges.—As to gauge, there are three classes of railroads in the United States. The New England and New York roads are four feet eight and a-half inches. In Ohio and south of Philadelphia they vary from this width to four feet ten inches. The Canada gauge is five feet six inches, of which gauge also are some of the roads of Maine. The broad gauge is six feet, of which the Erie, the Atlantic, and Great Western, and the Ohio and Mississippi are examples.

Mining Summary.

REESE RIVER.

Rich Strike at Geneva.—The Reese River *Reveille* of a late date says: Mr. Peter Gross, a miner from Geneva, yesterday brought us a piece of rock, from the Smoky Valley ledge, that indicates a mineral wealth unsurpassed by any mine in Nevada. The Smoky Valley ledge is one of the most prominent of this section of country, and crops out like a vast dyke for a distance of five miles, commencing at Geneva and running diagonally across the Tolyabe range, southwest, to the mountains heading Big creek. On it are the Everett, Smoky Valley, Illinois, Mammoth, and several other claims. The Smoky Valley Company are the first to open their mine to any great depth, and have struck it rich. They run a tunnel 340 feet, and struck the vein at the depth of from 165 to 175 feet, and have penetrated it seventeen feet, the last three of which is about half pure sulphuret ore. This opening of the Smoky Valley has established beyond a doubt the great value of this mammoth ledge, and opens a bright future for the little rock-embowered hamlet of Geneva. The clear and sparkling Birch creek, that now only serves for domestic purposes, will soon be more profitably employed than running away to no other music than its own babbling. The steam-whistle and the stampers will soon play another and more boisterous tune in that now quiet locality. The Smoky Valley and the Everett companies both have mill sites on the creek, and will proceed at once in the erection of mills of the first class and of great capacity.

Liberty—San Antonio.—Five tons of rock from the Liberty lode, San Antonio district, was lately worked at the California mill, paying over $330 a ton. Several fine bricks were made, of great purity, which we believe were shipped to-day for the west. The rock assayed $413 per ton, and the contract between Mr. Hyneman, the superintendent, and the mill company was, that it should be worked up to within twenty per cent. of the assay, which was done, and a little better.

The Naiad Queen.—Some time last Winter we noticed that Messrs. Strong & Robinson, of the Eagle mill, had struck a ledge while sinking a well. They are now working the vein, and have christened it the Naiad Queen. The owners of the claim have sunk to the depth of about thirty feet, and are now taking out some very fine ore. The ledge is a foot wide and averages $1,000 per ton. This is one of the richest localities in the district.

New Roaster.—We to-day noticed at the Eagle mill, a roaster which has the merit of being novel, in this region, at least. It is composed of a hollow iron cylinder, about twelve feet in length and three feet in diameter. This is placed over a furnace and caused to revolve by means of a drum attached to one end. The pulp to be roasted is placed in the cylinder, and as it revolves, must necessarily acquire a uniform heat.

Tom Corwin Company.—A fine ledge has recently been opened in Marshall cañon, a short distance south of the Whitlatch, and is now producing an excellent quality of sulphuret ore. The claim is owned by Messrs. Thomas Sawtelle and I. Mears, who have very quietly prosecuted its development. Their incline is now down 127 feet, and has opened a very regular lode of about one foot in thickness, containing ore throughout and a streak through the center nearly pure, and unmixed with quartz. It is estimated that the entire mass of vein-rock they have taken out will work up to $100 a ton.

WASHOE.

Mr. Abner West has furnished the Virginia *Enterprise* with much valuable information from Ione, Nye county, Nevada. As yet there is but one mill in that section, owned by a Sacramento company, and they only crush ore from their own lead, the Pleiades. Other companies have out large lots of rock, but there is no chance to get crushing done. The mill has but one battery of five stamps, though five stamps more will shortly be added. It is absolutely necessary to roast the ores. Without roasting, first-class ore will not pay in the mill. When roasted, second-class pays $150 per ton, and it is thought first-class will pay from $300 to $500. They are now putting up roasting furnaces. In the immediate vicinity of Ione are a great number of excellent leads: The Northern Star, now down 180 feet, and four feet in width, shows native silver in great abundance, which will pay $150 per ton. The Josephine, down 125 feet, to the water level. Their lode, two and a-half to three feet wide, is a mass of rich black sulphuret and ruby silver ores. The Shamrock No. 2 is a mine very rich in gold. When first found, $2,000 in gold was taken out of a pocket, only two feet below the surface. The shaft of this company is down 100 feet—lead two and a-half feet thick. The Andrew Jackson is down to the water level. The lead is about three feet thick, and affords some very rich rock. The Savage Company are down 120 feet, and the Shamrock eighty feet. All these companies have an abundance of very rich ores. The Pearl Company is down on its ledge fifty feet, and shows very rich in both gold and silver, with a two and a-half feet vein.

Several mills are greatly needed at this locality, but the mine owners, not being able to erect them, are waiting for capitalists. George Hearst, a large owner in the Gould & Curry, visited Ione last Fall, and purchased some valuable interests. It is reported that he will build a mill there during the coming Summer. When such men as Mr. Hearst identify themselves with a mining locality, it is sufficient evidence of the mines being good. He is a practical miner and a shrewd business man.

The Alpha Mine.—This ground is a part of the original Coppers & Mills claim, which originally contained 1,200 feet on the ledge, comprising one year ago the Minerva claim of 300 feet; the Superior, of 300 feet; the Alpha, of 300 feet; the Omega, of 290 feet; and the Apple & Bates, of ten feet. The Alpha at this time is owned by men who know its value, and who, from recent developments under the excellent management of Mr. Apple, says the Gold Hill *News*, refuse to sell at the prices quoted at any of the San Francisco Boards.

Como Items.—Palmyra district, says the *Union*, still insists on its due share of the public attention. The mill at Como is pounding away on rock from the Orizaba No. 2, with very satisfactory results. The crushing from the Rey del Monte is unknown, as a party who was entrusted with the bullion, after cleaning up, ran away with it, and has not yet been caught. The Montgomery Company, at the depth of 200 feet, are drifting to their ledge, and expect to cut it in about ten or fifteen feet further, at which point they must surely strike something very good. The Lancaster Company have suspended operations for a few days, preparatory to pitching into the work fiercer than ever.

CALIFORNIA.

Silver Lead.—Some very fine specimens of argentiferous galena have been received by Dr. Leach, of this town, says the Fresno *Times* of March 29th, from the quartz vein recently discovered by Mr. George Rivercomb, near his residence on Dry creek, in this county. Upon being subjected to the action of fire, in a common draught stove, large globules of silver could be seen upon the surface of the quartz. In its characteristics it compares favorably with the Hubbard and Gorgonian leads of Owen's river; side by side, the difference is scarcely perceptible. Quite a number of veins are reported as located on the vein.

Mariposa County.—The miners employed on the Princeton vein, in Mariposa county, who have been working on their own account since the Mariposa Company suspended, cleaned up on the 1st of April. The gross proceeds of eighteen days' run amounted to $10,000—leaving a nice little sum over and above the expenses of working.

Calaveras County.—The San Andreas *Register* has seen some specimens from the Columbus Copper claim, which look excellent. This claim is situated at Copperopolis, and on the same lead as the Union. The workmen are down about sixty feet, and have struck the main lode, which is about the width of their shaft. They have been sinking this shaft for some time past in hopes of finding the lode, and have at last "struck it." Messrs. Rathgib & Bros. cleaned up last week, from the rock which they have crushed since they started their mill, and realized twenty-three dollars a ton, from the rock crushed. Mr. Sciefford, who, with several others, own a quartz lode near the race-course, a short distance from town, have been crushing their rock with an arastra. Last week they cleaned up, the rock averaging twenty dollars per ton.

Nevada County.—The *Transcript* says that the lead of the Gold Tunnel Company, located on Deer creek, about a mile below Nevada, is the oldest quartz mining claim in that part of the county. The Miller brothers and a man named O'Connor erected a quartz mill in 1851, and succeeded in making considerable money, notwithstanding that the proper reduction of quartz was then unknown, and considerable gold was lost for the want of suitable machinery to save it. The lead has since been worked by a number of parties with varied success. The Gold Tunnel is now in the possession of men who have a thorough knowledge in quartz mining, and they are in a fair way to make a large fortune out of it. We are informed that a day or two since some of the best rock ever found about Nevada was struck in this claim, and that the lead will surpass anything in this neighborhood for richness.

Mining at Moore's Flat.—During the severe weather of the Winter the ground has been so constantly covered with snow or frozen as greatly to impede mining operations at Moore's Flat. A number of large companies have been at work continuously, says the *Transcript*, but little or no prospecting has been done, and all mining operations were "slow" on account of cold weather. The weather is now getting to be pleasant and warm, the snow is fast disappearing, and there is every indication that Moore's will be one of the liveliest camps in the county the coming season.

Yuba County.—The Marysville *Appeal* learns that the Pennsylvania Company are progressing fairly, and that their cleaning up now nearly covers expenses. Within a few days they will be able to supply their mill with none but good pay rock, and it is expected that their receipts will then be steadily improving and become more and more satisfactory. In order to help them squaring up old accounts, and, perhaps, procuring a somewhat larger engine, they have finally levied a small assessment. If they could but crush twenty-five tons of quartz in twenty-four hours, instead of twelve tons (the quantity they are now crushing), their expenses would increase but little, while their receipts would be doubled at once.

Shasta.—A company is being formed at Shasta for the purpose of tunneling through a point on the Sacramento river, just above its confluence with Pitt river, and turning the stream through it. The scheme is said to be very feasible, and can easily and cheaply be done. Some two miles of the river bed, which is supposed to be rich in gold, will be thoroughly drained by this operation.

THE NORTHERN MINES.

The Idaho *World* say that a ledge has been lately discovered a few miles below Centerville, which is thought to be the richest they have yet struck, in gold. The specimens taken from it are literally yellow with the precious metal. It is called the Sarsfield. Mr. J. M. Moore arrived there from San Francisco, with additional machinery for the quartz mill at Owyhee. He reports that this Territory will be visited, in the Spring, by representatives of some of the leading capitalists of San Francisco, on a tour of inspection through the quartz mines.

The New Mining Region.—One thousand claims are being worked in the new diggings lately struck on Wild Horse creek, in the Kootenai country.

The Prospects of Owyhee.—A private letter from Owyhee says that a great many feet are changing hands at present, but money is very scarce; but with the opening of Spring, no doubt money will become abundant, as a great deal of bullion has been sent below for coinage. There have been some 4[illegible]0 lodes located up to the present time, and I have no doubt but there will be a thousand more the coming season. Out of nearly one thousand assays and tests of quartz that I have made, I have only found two which did not contain gold and silver. The assays that I have made range from $2.50 to $26,000 per ton. The rock that has been crushed averages better than the Washoe rock. The lodes increase rapidly in width as they go down. At a depth of 150 feet, the Morning Star is nine feet wide; the Oro Fino, at a depth of 100 feet, is eight and a-half feet wide; the Allison, at a depth of eighty feet, will average $800 per ton. A great number of the lodes that are already located will average $60 per ton. Good quartz miners readily command $75 per month and board; some get $100. Flour is worth thirty dollars per hundred: sugar, sixty cents per pound; bacon the same; coffee, seventy-five cents; butter, one dollar and a-half; board, eighteen dollars per week, with two meals per day.

Retentive Power of Soils.

Soils are divided or classified according to the preponderance of their constituents of sand, clay, lime and animal or vegetable remains or humus.

Sandy soils contain over eighty per cent. of silicious sand. Calcareous soils contain over twenty per cent. of lime. Clay soils contain over fifty per cent. of clay. Vegetable moulds contain over six per cent. of organic matter or humus. Marly soils contain more than five per cent. of lime, but not over twenty per cent. of the weight of dry earth, and from twenty per cent. to fifty per cent. of clay.

Loamy soils are those in which the proportion of clay varies from twenty to fifty per cent., and which at the same time hold less than five per cent. of lime, and so on.

Now it is found that the power of retaining or holding moisture depends on the composition of the soil. Thus an experiment designed to show the retentive power of these different soils, resulted in the following manner. In 100 pounds of dry soil water will begin to drip, if it is a

Quartz sand, when it has absorbed	25	pounds	water.
Calcareous sand	"	"	29	"	"
Loamy soil	"	"	40	"	"
English chalk	"	"	45	"	"
Clay loam	"	"	50	"	"
Pure clay	"	"	75	"	"

Those soils which absorb the greatest amount of water, hold it with the greatest tenacity. Dark-colored soils absorb and hold a greater amount of the heat of the sun's rays than light-colored ones, but the light-colored retain the rays longest. Many circumstances besides the chemical composition of a soil, exercise an extensive influence upon its productive or fertilizing power.

The absorptive power of soils is so great, that they separate ammonia from its various solutions. If liquid ammonia is passed through a quantity of soil, it loses its ammonia, and the odor which indicated its presence. But there is a limit to this power. If the quantity of soil is too small, the ammonia will not all be taken out.

Soils also have the power of absorbing potash in solution. A stiffish subsoil, when simply thrown out and exposed to the air and rains, would become to some extent impregnated with these salts, and hence their value as absorbents in the yard, or mixed in the manure heap. But all cultivated soils have the power of separating the potash, ammonia and other alkaline substances from their various combinations, differing only in degrees.—*Massachusetts Ploughman.*

When Gas was Introduced.—The gas used for ordinary purposes is one of the products of the destructive distillations of pit coal, submitted to a great heat in cast-iron retorts. Certain permanent gases are given off, and are collected in a large pipe half filled with tar, after which they pass through a series of iron pipes, cooled on the outside by streams of water. The tar and ammonical liquid generated are thus condensed, and the gases proceed to another part of the apparatus, called the purifier. After being submitted to the purifying process, it is collected into large reservoirs, called gasometers (more correctly gas-holders), from which it is conveyed by large pipes, afterwards branching off into lesser ones, to all parts of the town. The artificial production of an inflammable air from coal is first mentioned by the Rev. Mr. Clayton, in a letter addressed to the Royal Society, May 12, 1788; he states that he distilled coal in a close vessel, collecting the gas in bladders, and afterwards burning it for the amusement of his friends. In the year 1797, he erected a similar apparatus in Ayreshire, where he then resided, and in 1798 he was engaged to put up his apparatus at the manufactory of Messrs. Boulton, Watts & Co., Soho, near Birmingham. The illumination of the Soho Works by gas in 1803, on the occasion of peace, brought it into general notice, and it was soon adopted by many individuals, who, acting upon their own ideas, introduced various methods of collecting and purifying it. A public exhibition of it in London took place in 1806. Golden Lane was lighted with it in 1807, Pall Mall in 1809, and all the streets generally in 1814.

The Arts Among the Ancient Mexicans.—The arts and trades of the ancient Mexicans produced not only what was indispensable to the necessaries of life, but also for articles of luxury. They were clever in weaving cottou; they made a sort of cuirass (*escaupil*) impenetrable to arrows, they knew how to tint their clothes with a large variety of mineral or vegetable colors. They baked pottery for domestic use, and, like the Russians of our own day, made utensils of varnished wood. They had no iron; that useful metal was not known, or at least was not in great use, on either continent, till long after civilization had spread, but, like the Egyptians and the elder Greeks, for their tools the Mexicans used bronze, which by hammering acquires great hardness. Bronze, however, was not common among them, since they employed for the same purpose "obsidian," (called by them *itzli*,) a vitreous mineral substance, but harder than glass, and belonging to volcanic regions.

They excelled in giving an edge to this natural glass, making out of it knives, razors, (for barbers,) and pike or arrow-heads. From their mines, though rudely worked, they extracted lead, tin, silver, gold, copper. They were proficients in fashioning the precious metals. The ornuments and silver that Cortez received from Montezuma before reaching the table land, and those he found at Mexico, were moulded, soldered, sculptured by the graver, enriched with cut stones, enameled with skill at least equal to that then attained by the majority of the goldsmiths of Europe; and the latter admitted themselves vanquished, if we may credit the authors cotemporary with the conquest. "No prince in the world," writes Cortez to Charles the Fifth, "possesses jewels of such great value as Montezuma," and he clearly states that the workiug was in no way inferior to the material.—*M. Chevalier.*

A Fortunate Artist.—A. T. Stewart, the New York millionaire, has offered $20,000 for Bierstadt's painting of "Robin Hood," Oregon. The Web-feet may think that this is more than the mountain itself is worth.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, April 22, 1865.

The sudden death of the late Chief Magistrate of the Nation, on Saturday last, produced a profound impression upon all classes, and until within the past day or two this sad event has almost entirely absorbed their attention. The members of the Board of Brokers united with their fellow-citizens on Wednesday in paying funeral honors to the deceased President, and business in all circles has been very much depressed during the week, in view of these solemnities.

The money market is growing easier, but without any abatement in rates of interest, as yet. Capital, however, is abundant and no stringency is anticipated the coming season. Parties in good credit are accommodated in bank at 1½ ₱ cent. per month, and in the open market negotiations are made at 2@2½ ₱ cent. per month.

Receipts of treasure since the 1st inst., from the interior and north coast, amounted to $3,200,000.

Bullion is in better request, and gold bars are selling at 820@830. Silver is also in demand, and bars of average fineness are worth from ½ to 1 ₱ cent. premium.

Deposits of gold and silver bullion in the U. S. Branch Mint have exceeded $2,000,000, since April 1st. The following is an abstract of the operations of that establishment for the quarter ending March 31st:

Gold and silver bullion receipts for the first quarter, 1865.

GOLD.

Standard weight of gold bullion received	ozs. 189,487.412
Value	$3,525,347 20
Standard weight of gold bullion parted from silver	ozs. 671.207
Value	$12.487 75

SILVER.

Standard weight of silver bullion received	ozs. 30,017.91
Value	$36,321 07
Standard weight of silver bullion parted from gold	ozs. 22,418 50
Value	$26,036 98
Total standard weight of gold bullion received and parted	ozs. 190,158.619
Value	$3,537,834 77
Total standard weight of silver bullion received and parted	ozs. 52,436.41
Value	$62,408 65

Coinage during the first quarter, 1865, ending March 31st.

GOLD.

137,750 Double Eagles	$2,755,000 00
3,000 Eagles	30,000 00
3,112 Half Eagles	15,560 00
8,250 Quarter Eagles	20,640 00
152,118 Pieces, valued at	$2,821,200 00

SILVER.

07,000 Half Dollars	$48,500 00
22,000 Quarter Dollars	5,500 00
60,000 Dimes	6,000 00
36,000 Half Dimes	1,800 00
215,000 Pieces, valued at	$61,800 00

As the Branch Mint opened on the 16th of March, after a suspension of business for the period of a month, during the settlement of the accounts of the late Melter and Refiner, and pending the appointment of a successor, the above report necessarily comprises but two months' operations.

Legal Tender Notes rose from 66½ to 67½c, receded to 67, advanced to 74, buyer 30, fell to 71⅞, rallied to 71⅞, and closed at 71½ bid, 71⅝ asked. Within this range $185,000 par value have changed hands. Gold, during the week, has fluctuated between 149@137, and closed yesterday in New York at 147½.

The share market early in the week was depressed, and nearly all stocks declined materially. Within the past day or two, however, a decided improvement has taken place, and a much better feeling prevails. Leading Washoe claims are yielding well, and dividends for the current month will be fully up to the aggregate of the past month.

Yellow Jacket declined from $2,400 per foot to $2,350, advanced to $2,400; at which rates small transactions took place. Negotiations are in progress for the purchase of the Morgan mill, on the Carson river. The capacity of this mill is now about 50 tons per day, but ten additional stamps are to be at once erected, and its reduction power will be materially increased. The terms of this contemplated sale to the Yellow Jacket Company are easy, and will not be likely to interfere with the regular dividends to the stockholders. In drifting southwest from the lower level of the mine, the strata of pay ore is now 10 feet wide, and in the north drift, same level, the vein contains good ore and is 40 to 50 feet in width. The product of this claim for the past month amounted to some 7,700 tons of ore, averaging $40 per ton.

Gould & Curry has been inactive, but steady at $1,975, and closed at $1,975 bid, $1,990 asked. The D street shaft is now down 200 feet below the lower tunnel, and preparations are being made to drift at this depth. The yield of the mine is undiminished, and fully up to the average of the past few months.

Savage receded from $2,000 to $1,990 per foot, rallying to $2,015, and closing at about $2,010 bid. Within this range 23 feet were sold. There is no new feature in this mine. Receipts of bullion are as large as usual, and the regular dividend of $75 per foot will be declared for the current month.

Belcher has been largely dealt in, and 53 feet were sold at fluctuating rates, opening at $1,720, declining to $1,595, advancing to $1,675, buyer 30, receding to $1,620, and closing yesterday at $1,670, buyer 30. The lower level is improving, and a vein of rich ore, eight feet in width, has been found this week.

Crown Point declined from $1,350 to $1,125, rallied to $1,170, and closed at $1,310 bid. At this range 26 feet were sold. We can learn of nothing unfavorable in the appearance of the lode in this mine. On or about the 1st proximo shafts will be sunk from the 225 feet level, to open the mine at a greater depth.

Chollar declined early in the week from $820 to $780, since rising to $860, buyer 30, and selling yesterday afternoon to $840. Within this range 84 feet were sold. From the fifth level in the north mine, and the fourth level in the south mine, about 100 tons of fair ore are daily being hoisted to the surface. Potosi is also in better request, advancing from $850 to $870, and selling at the close at $890. The product of this mine is now about 180 tons per day, averaging some $45 per ton. The Chollar & Potosi Company, representing 2,800 feet of stock, commences operations under the new management on the 1st of May next.

Alpha (G. H.) was sold during the week at $800 per foot, and is now in request at $950 bid. This claim is beginning to attract considerable attention, and in the lowest level of this promising mine, at a depth of 565 feet, a large body of good ore has recently been found.

Ophir is in less favor, and steadily declined from $575 to $520, seller 60, closing at $560. Some 31 feet were sold.

Empire Mill & Mining Company is well held at $475 per share. Bacon is in some request at $220 per share bid, $250 asked.

Confidence is offered at $175 per share, and Minerva is inquired for at $200 per share.

Hale & Norcross has been very steadily maintained at $595@$600, and is now held at the latter figure; 13 feet have been sold.

Uncle Sam declined from $300 to $275, rallied to $290, and closes at $300. Some 49 feet were sold. Overman was dealt in at about the same figures.

Imperial met with a decided improvement yesterday morning, advancing from $205 to $214 per share, and selling at the close at $240. In sinking and drifting from the present lower level, a large body of good ore has been disclosed some ninety feet in perpendicular depth, averaging about sixty feet in width and believed to extend one hundred and eighteen feet in length.

Bullion declined from $155 to $145, seller 30, rallied to $151, and closes at about $160 bid. Burning Moscow steadily rose from $35 to $53 per share.

Wide West was sold at $16@$16½; Sierra Nevada sold at $23@$25; Sheba was dealt in at $37@$38; Caledonia Tunnel declined from $16 to $14.

The aggregate sales of Stocks and Legal Tender Notes since Monday last (there being no session of the Board on Saturday or Wednesday) amounted to $617,985.

Anything above $3,000 per foot, three-quarters of one per cent. on the amount of purchase or sale.

FRANK LAWTON, Secretary.

J. B. E. CAVALLIER, President.

Mechanical.

Sound Reasoning.—The Marysville *Appeal* does not see why the people of that city should not erect a woolen mill as well as the Sacramentans. If they have a capital of $30,000 to invest in a theater, which will only pay the lowest rates of interest at best, why cannot they raise $60,000 for the erection of a woolen mill, which will pay better?—*Exchange.*

If woolen mills could be made to take the place of theaters generally throughout the State, it would work a decided change for the better in California, not only morally, but pecuniarily. We trust our Marysville friends will try the experiment.

A New Dentists' Chair.—Dr. William M. Butler, a dentist of this city, has recently invented an improved dental chair, which is said to add much to the comfort and convenience of dental operations. Applications for a patent have been made through the Patent Agency connected with this office.

Among the recent inventions announced is an apparatus styled the "Army Filterer," which must be especially valuable to miners also. It consists of a gutta-percha tube with a mouth piece attached and a "filter" inside, that enables a prospector to obtain a draught of pure, clear water from any muddy pool. It is described as practical and invaluable. Another apparatus from the same inventor is a Respirator, which in dry crushing of quartz would prove to be invaluable to the operatives, as it is so adjusted to the face that it is impossible for any dust to enter the lungs, and it is comfortable to wear. The cost of each of these articles is trifling and each really useful in this country.

Another invention is called a patent self-acting wagon-brake. The brake is attached to the wagon-tongue, and the tongue is so constructed as to slip back some inches when the team commences holding back in going down hill. The hind wheels are effectually locked in an instant by eccentric cams, which are thus pushed against them, and the greater the pressure of the load and the steeper the hill, the more thoroughly is the locking accomplished. It was invented and pateuted by M. K. Lewis, of Iowa.

Aldrich's Gopher Trap, is a recent invention which is coming into general use in Santa Clara county. It is a steel trap, the mouth of which is inserted into the Gopher hole. It is said to be sure to catch, requires no bait and is a great saving in money and labor over the old method of destroying these pests to the farmers, by means of strychuiue. The traps are manufactured in Oakland.

A beautiful polish is given to linen thread by a curious process. After the thread is reeled in skeins, a stout workman takes a bunch as big as his arm, and catches it upon an iron hook, then, passing a stiff stick through the opposite end of the loop, twists the thread tightly with all his might. Immediately untwisting, he catches it in another part upon the hook, and gives it another twist. A few repetitions of this process impart to the thread a most beautiful, smooth, silken finish.

California Made Clothing.—The proprietors of one of the largest clothing establishments of this city are contemplating the manufacture of their own goods from California made cloth, instead of importing their suits already made from the East, as is now the uniform rule of San Francisco clothing merchants. This is a step in the right direction. It will at once patronize home manufacture and give employment to many who need it.

Iron Manufacture.—At a village called Oswego, on the banks of the Willamette, ten miles from Portland, Oregon, is a mountain of iron ore. A company has been formed, and a furnace and rolling mill will shortly be erected.

Heavy Work.—A few days since two blocks of granite, six tons each, were sent from Folsom to this city, intended for bed pieces for the embrasures at Fort Point, for the thirteen-inch guns.

What is an Inch of Rain.—The late weekly return of the British Registrar-General gives the following interesting information in respect to rainfall: Rain fell in London to the amount of 0.43 inches, which is equivalent to forty-three tons of rain per acre. The rainfall during a week, lately, varied from thirty tons per acre in Edinburgh, to two hundred and fifteen tons per acre in Glasgow. An English acre consist of 6,272,640 square inches; and an inch deep of rain on an acre yields 6,272,640 cubic inches of water, which, at 277,274 cubic inches to the gallon, makes 22,622.5 gallons; and, as a gallon of distilled water weighs ten pounds, the rainfall on an acre is 226,225 pounds avoirdupois; but 2,240 ponnds are a ton, and consequently an inch deep of rain weighs 100,993 tons, or nearly 101 tons per acre. For every one-hundredth of an inch a ton of water falls per acre.

Improvements in Photography.

A new method has recently been invented by a French photographer for doing away with nitrate of silver in photography. It consists in tizing the albumenized paper with a mixture of one part of biehromate of potash and two parts of sulphate of copper, on which it is floated for a few minutes. It is then dried before the fire in the absence of daylight, put under a negative with the printed side turned upward. The action of light is as rapid in this as in the ordinary method. The print is then floated on a decoction of Campeachy wood, to which a little warm water is added. The image is thus developed, and when it has attained a sufficient depth of tint, it is dipped into a bath of hot water, which carries off the excess of Campeachy; next it is rinsed in either warm or cold water and varnished.

The photographic public is greatly excited by the announcement in a Mauritius paper that a photographer of Port Louis, named Chambay, has succeeded in fixing the colored rays. The photographs obtained by the new process are stated to be absolutely perfect, "equal to the finest pastels, water-colors, or miniature paintings." It is said that the lucky inventor is going to Paris to display his skill, and to take out a patent for his discovery.

An autographic telegraph is also about to be established at Paris. By means of this machine, in a few seconds, the *fac simile* of a portrait, hand writing, or signature can be reproduced at a distance of several hundred miles. Thus, you wish to send your portrait from Paris to Vienna. Every stroke of the artist's pencil executed by means of the pantelegraphic machine in Paris is simultaneously reproduced at Vienna. Two distinguished artists, MM. Berstall and Bauginet, drew likenesses which were instantly transmitted a distance of 400 miles. M. Casselli has even accomplished printing in colors at a fabulous distance. For instance, at the office a rose appeared on a blank sheet of paper in the most brilliant coloring, telegraphed from the Imperial observatory, both the flower and leaves being painted in natural colors. The process used is similar to that employed for painting leaves on stuff. The autographic telegraph transmits per hour thirty dispatches containing twenty words in each. It is equally possible to stenograph by the pantelegraphic machine with marvelous rapidity, and from its peculiar construction it will work under atmospheric circumstances which impede the action of ordinary telegraphs.

The Mysteries of Iron.—There is no miracle recorded in the annals of any religion more mysterious, more incomprehensible, more inconceivable, than some of the well-known properties of that simple metal, iron. Consider, for instance, its change from its ordinary to its passive state. If a piece of the metal in its ordinary condition is immersed in nitric acid, it is powerfully acted upon, entering into combination with the acid and losing its metallic form. But if a piece of platinum wire has one end inserted in the acid and the iron is then immersed in contact with the wire, it is so changed that the acid has power upon it, and this condition continues after the platinum wire is withdrawn. The contact of a single point with the platinum sends a transformation through all its particles, which renders them invulnerable to the attacks of the most powerful acid. Even more wouderful is its change under the influence of a current of electricity. When a bar of pure soft iron is welded with an insulated wire and a current of electricity is sent through the wire, the bar is instantly converted into a magnet. It is endowed with an unseen force which stretches out from its ends, and seizing any other pieces of iron within its reach draws them to itself, and holds them in its invisible grasp. The object of insulating the wire is to prevent the electricity from leaving it, and yet through this insulating coat a power is exerted which changes so strangely the nature of the iron, enabling it to act on substances with which it is not in contact. As soon as the circulating current ceases, the iron becomes like Samson shorn of his locks, its miraculous power has departed. No less mysterious than either of these is the more familiar phenomenon of the fall of a piece of iron to the ground, under the simple action of gravitation. What is that invisible force which reaches out in all directions from the earth, and clutches all matter in its grasp? The fibres of this power are imperceptible to any of our senses. If we pass our hands under a suspended rock we can feel nothing reaching from it to the earth, yet there is something stretching up from the earth, taking hold of the rock, and drawing it down with the strength of a hundred cables. We walk enveloped in mysteries, and "our daily life is a miracle."

In one of the processes of steel pen making, done by females at Birmingham, a quick worker will cut out in one day, of ten working hours, 250 gross, or 36,000 pens, which involves 72,000 distinct motions of the arm—two every second.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, and if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by prosecuting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we make a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of consulting models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or incommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on prescuting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent, and bring to bear upon the case any new evidence in all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on some conspicuous part.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-fronts, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicos, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal.* Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building, up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

Mining and Scientific Press.

W. B EWER, ... SENIOR EDITOR.

C. W. H. SMITH. W. B. EWER. A. T. DEWEY.

DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance,.....$5 00
One copy, six months, in advance,..... 3 00
☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, April 22, 1865.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyser, of Grass Valley, for Nevada county.

Removal.

The Office of the Mining and Scientific Press has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Nianile Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive Job Printing Office.

San Francisco, April 10th, 1865.

THE OIL HUNT.

There seems to be no abatement to the hunt after oil. Hundreds of men are now out in almost every possible direction in this business. Reports of oil discoveries are constantly coming in from almost every direction, and the most extensive preparations are being made for boring. The wish may be father to the hope, but certain it is that the most confident anticipations are beginning to be quite generally entertained, that the success which has attended the development of the oil wells at the East, will be fully realized in this State.

The oil indications are chiefly found on the opposite flanks of the Coast Range and its various spurs, wherever the sand rock and limestones have neither been too much denuded by the action of the elements, or too deeply hurried beneath the debris of the more elevated portions of the upthrow. The "springe" are usually found at the out-crop of the sandstone, the oil being brought to the surface in connection with water. Some indications of oil have also been found among the foot-hills of the Sierra Nevada, proceeding, in all probability, from bituminous shales, which often accompany the coal and oil measures. Such indications have been noticed in Placer, Nevada and El Dorado counties. The probability of finding oil in paying quantities in those localities is extremely doubtful; nevertheless, we understand that a company has been formed for testing the value of these indications in Placer county, and that they have already been boring for some time, in hope of tapping a stream or reservoir of that liquid. We believe it is also in contemplation to bore at a point in Nevada county, near San Juan. We wish the adventurers the utmost measure of success.

Oil indications and springs, and beds of asphaltum are also found on the Eastern slope of the Sierra, and at intervals entirely across the Great Basin, and near the foot hills on both flanks of the Rocky Mountains. Preparations are now being made to develop these resources, at points in Carson Valley, and in Colorado, near Pike's Peak.

In Santa Cruz, according to the Pajaro *Times*, parties are prospecting with considerable energy. The same is true of Colusa, Contra Costa, Humboldt and several other counties, both North and South.

PROBABILITIES OF SUCCESS.

There is no doubt but that the *indications* of oil in California are much more abundant than in the Atlantic States; but this circumstance is plainly attributable to the fact that this region has been subjected to a greater amount of disturbance. This disturbance has afforded numerous opportunities for outlets to the oil; but at the same time, it is reasonable to infer that it has also greatly reduced the chances of finding reservoirs of the oleaginous liquid. The wonderful success of the Eastern wells is plainly attributable to the uniformity and horizontal position of the rocks through which they are bored, the dip of stratification being scarcely perceptible. The original contents of the rocks have therefore been well preserved. The condition of the oil measures in this State, especially to the west of the Coast Range Mountains, so far as we have observed or been able to learn, is quite the reverse of those at the East. They are for the most part found here, crushed, up-thrown and overthrown, contorted and fractured to a most remarkable extent, thereby having been exposed to chemical action of air and water, until in many cases they have been quite metamorphosed. This disturbance it is to be feared has given abundant vent to the oils, thereby allowing them to be converted into gases which have escaped into the atmosphere, while the less volatile portions have been hardened into asphaltum, etc. To what extent this action has been carried on can only be known by actual exploration; and that exploration should be conducted by parties who thoroughly understand the phenomena with which the various localities are surrounded.

In order to prevent discouragement and loss, these explorations should be commenced in the most favorable localities, leaving our people to gradually feel their way along to success and fortune. It is greatly to be feared that the indiscriminate rush which we are now making for everything that looks like oil, will eventuate in as general and equally disastrous failures as those which followed a similar indiscriminate plunge into the silver mines of Washoe.

There is much reason to apprehend that the opposite slopes of the Coast Range in this State will prove quite similar in character to those of the Alleghanies, where those mountains pass through Pennsylvania and Virginia, and perhaps still further south. There, the eastern slope or ocean face of the mountains is very much disturbed, much after the western slope or ocean face of the California Coast Range. The consequence has been that the oils which they undoubtedly contained at an early period of time have been lost by dissolution and evaporation, while upon the opposite slope, or westerly side, where the strata has not been disturbed, the oil is found almost hermetically sealed, in inexhaustible quantities. Identically, the same rocks occur on both slopes—in the East the geological disturbance have accomplished the exhaustive process, which the hand of man is now doing on the western slope, by artificial means, utilizing the product as it is brought to light.

The eastern slope of the Coast Range of this State corresponds, geologically, to the western slope of the Atlantic Coast Range, or Alleghanies; hence there is good reason for believing that similar results will be obtained here as there, in our search after oil.

We have said that the eastern slope of the Coast Range corresponds to the western slope of the Alleghanies. It does so, however, only in a measure. On looking at a map of North America, it will be perceived that the valley of the Sacramento and San Joaquin, which is bounded on opposite sides by the Coast Range and Sierra Nevada, is but a low flat ravine in comparison with the magnificent valley of the Mississippi, which has the Alleghanies and Rocky Mountains for its opposite boundaries. Throughout the vast extent of the Mississippi, the underlying rocks have been subjected to very little disturbance, and that disturbance has chiefly been confined to slight upheavals, which have *bent* but not *broken* the strata. In other words the coal and oil measures throughout that valley, with a few isolated exceptions, present a rolling surface, or a series of sub-anticlinal axes. Now this is just such a disturbance which is in the highest possible degree favorable for the formation of reservoirs for oil, which reservoirs are hermetically sealed, and where the oil remains partly condensed in fissures and caverns, or permeating entire strata of shale and sandstones, and in all cases under great pressure from resulting gas and the weight of the overlying coal measures. Here it is securely held, ready for an explosive rush to the surface, the moment an artificial outlet is provided.

Now the Sacramento Valley, being of more limited extent, the opposite seats of disturbance present a nearer parallelism, and consequently do not afford sufficient scope for intervening sub-anticlinal axes, or if they exist at all, they are completely hidden from observation by the heavy accumulation of debris, which has filled up the valley. The position of the coal and oil measures under that valley is yet to be shown. Should it assume a comparatively horizontal position immediately after leaving the foot-hills the indication is extremely favorable for finding oil in remunerative quantities. The only explorations yet made in this direction have been at the Mount Diablo coal mines. The shaft being sunk by the Independent Company, at Sommerville, would lead us to suspect that the coal measures continue very much tilted as they descend into the valley. The oil well now being bored by the Adams Company, in the oil measures beneath the coal, and near by, to all appearances leads to the same conclusion. But the near vicinage of these localities to the exceptional and comparatively isolated disturbance of Mount Diablo, does not necessitate the apprehension of a similar degree of disturbance at other points along the eastern flank of the Coast Range. On the contrary there is much reason for believing the strata along this flank is generally favorable for oil, but lacking in the extraordinary conditions of the sub-anticlinal axes which are so frequently found in the eastern coal regions, and in which are found the most valuable of the flowing and blowing wells.

We may err in the opinion which we have formed, chiefly from hearsay, with regard to the geological *status* of most of the localities where oil indications are found to the west of the Coast Range; but we think that we are fully warranted in saying that wherever the strata dips at as high an angle as thirty degrees there is very little probability of finding oil, unless that inclination is due to a simple *flexure*, in which the rock is bent and not broken. In such a case the indication is decidedly *favorable*, as indicative of a sub-anticlinal axis. Facts, so far as we have been enabled to gather them, from printed reports and personal conversation with eastern oil borers, do not warrant us in counting with any degree of certainty upon finding remunerative wells in strata which dip at an angle exceeding eight or ten degrees. We trust that experience may give us more latitude; but in the outset of this business, we feel it incumbent upon us to warn our over enthusiastic oil prospectors against being too easily deceived by "indications," which may lead only to disaster and ruin. Let us take things coolly. Quite enough has already been undertaken to prove almost every possible contingency which we can expect to encounter. Let us wait until some positive development have been reached, upon which we can base our calculations. A hundred tunnels were run into the mountain at Iowa Hill, in Placer county, in 1854, to determine a question which two or three might quite as well have ascertained. The work proved a failure, at a cost thirty times what it need to have done. A similar experience has become a matter of history with regard to operations in Washoe. Let us profit by the past.

God washes the eyes with tears until they can behold the land where tears shall be no more.

DISINTEGRATING ORE COMPANY.

This is the title of a company recently organized in New York, which has purchased from the inventor a patented process for the treatment of ores, whereby it is claimed that the most stubborn sulphurets of gold, silver and other metals may be readily and completely desulphurized, and with far less original outlay and working cost than is possible by any other known process. It is furthermore claimed that the ores can be worked by this process up to within ninety-five per cent. of the assay. Large quantities can be treated in a single apparatus. The company proposes to take early and active measures to introduce their process to the notice of the mining interests generally. We know nothing of the merits of this supposed discovery beyond the published prospectus of the company; but shall watch closely for any practical results which may transpire, and communicate them, when received, to our readers. Some idea of the process may possibly be obtained from the following brief statement:

They take the sulphur, arsenic and phosphorus from the ore by attraction, and oxydize the baser metals; or, in other words, they attack sulphur, arsenic and phosphorous, in a heated condition, by hydrogen gas, which become by the contact, sulphureted, arsenureted, or phosphureted hydrogen gas, as the case may be, and simultaneously another agent follows and oxydizes the antimony and the baser metals, copper, iron, etc.

By that process, the hardest minerals, combined with metals, are decomposed or disintegrated, so that, when thus treated, it is only necessary to pass the residuum between the grinding surfaces of mill-stones, in order to remove the oxyd from the metallic particles, after which treatment it is ready for amalgamation.

It is contended by the corporators of the Disintegrating Ore Company that the first outlay for apparatus, including motive power, will be about two-thirds less than the cost of the expensive, complicated and cumbersome machinery heretofore employed in practical mining operations; while the material required for the construction of the apparatus is mostly within the reach of miners, on their own ground. Those parts requiring transportation are easily obtained, and can be moved from point to point with perfect ease.

A State Geological Survey for $6,000!—The late Nevada Legislature, among its many really valuable acts, passed a bill which provides for the creation of the office of State Geologist, and the appointment of a competent person who shall be known as the "State Geologist of Nevada." The person so appointed to "make a preliminary and superficial survey of the mineral regions of the State, and to collect suitable specimens, and to arrange and classify them in a cabinet, and to make a map, marked and colored, to indicate the general geological divisions as developed, of the country examined. The making of this survey is not to exceed eight months, and $6,000 are appropriated to pay for it." The provisions of the above bill are simply absurd, and can result in no possible benefit to any other party than the one who pockets the $6,000. If the sum appropriated could be placed in the hands of some competent and thoroughly practical man, who should first familiarize himself with the general character of the ores of Nevada and the modes of treatment, machinery, etc., adopted there; with instructions to afterwards visit and institute examinations and comparisons of the same kind in Europe, and report upon the same on his return, a large amount of important information might be obtained which would be of real value to the State. A geological survey, to be of any use, must be thorough, and could not be made by any one man in two or five years, or for ten times the amount named in the bill.

A Good Idea.—The draymen of Indianapolis have an insurance company among themselves, for the insurance of their horses. When one of their horses dies, the company makes up a certain amount for his loss, agreed upon. This is a good arrangement.

A burlesque called "Petroleumania, or Oil on the Brain," has been brought out at one of the minor theaters in New York.

THE CALIFORNIA COPPER SMELTING WORKS.

We understand that the California Copper Smelting Works, at Antioch, are now in the full tide of most successful experiment. The difficulties which have hitherto beset the path of progress in this important enterprise have been happily and fully removed, and the works are now in full blast. The curse of this, as well as of many other undertakings in California, has been the impatience of stockholders to realize a profit on their investments, without taking into consideration the difficulties which attend an undertaking of this character.

The reduction of copper ores is one of the most difficult processes in metallurgy or chemistry. When the California Copper Smelting Works commenced operations, the nature of the ores to be treated, character of the elements of reduction and the quality of the metals for the construction of furnace bottoms—an indispensable element of success—were comparatively unknown. Experiments were made, at first with indifferent success, but gradually improving, until at the present time, the company has every reason to believe they have found a proper combination of materials for a substantial "bottom," and that all other matters pertaining to a successful working have been brought to an equal degree of perfection.

The furnaces are now producing *regulus* of forty per cent. copper, which will be reduced to black copper by a second fusion, giving metal of from eighty-five to ninety per cent. pure copper.

It is believed that when the coal companies of Mount Diablo shall come to the conviction that their interests are identical with those of smelting works, the public may count on a degree of success, in this enterprise, which will render it one of the most important interests on the Pacific coast; and one that will call for a vast consumption of California coal, and render marketable thousands of tons of copper ore, of no present value.

It may be proper, in this connection, to state that the furnaces employed at the Antioch works are quite dissimilar from those used at Copperopolis—the former being reverberatory, and the latter cupola furnaces. This difference in the construction of the furnaces employed is rendered necessary on account of the different character of the coal used at the two places.

DEAD WHALE ASPHALTUM COMPANY, is the euphoneous title under which a company was incorporated, in this city, on Tuesday last. The company has been organized for the purpose of extracting asphaltum, by mining or otherwise, in Santa Barbara county. The capital stock is fixed at $50,000, divided into 100 shares of $50 each. The corporators are Nelson Pierce, Joseph S. Garcia and Wm. H. Morton, of this city, and Pedro P. Massini, of Santa Barbara.

A COPPER MINING COMPANY.—The Queen of Bronze Copper Mining Company has filed its certificate of incorporation in the office of the Clerk of the County Court. The seat of its operations is located at Sailor's Diggings, Josephine county, Oregon. Capital stock—$792,000, which is divided into 7,920 shares of $100 each. Trustees—Paul D'Heirry, R. J. Forbes and Henry Wilkins.

THE Black Hills of Dakota have recently become an object of interest. A Detroit paper says:

There has long been an impression that these hills, which have been heretofore jealously guarded by the Indians, contain most valuable mineral wealth, as well as timber, which in Dakota is even more valuable, and now that the Sioux war is declared ended, it is supposed that no obstacle will be offered to their thorough exploration.

DURING the bombardment of Charleston the military authorities kept a lookout in the high steeple of St. Michael's Church, in which may yet be seen the sanctum of the officer appointed to count the number and effect of the shells during the siege.

A HELPING word to one in trouble is often like a switch on a railroad track—but one inch between wreck and smooth rolling prosperity.

A MINE OF ANTIMONY.

Late Eastern papers make mention, as among the latest mineral discoveries, that of a mine of antimony, which was struck by a party of oil borers, while searching for oil in Wirt county, West Virginia. It is further stated that $350 per ton (currency) was offered for all that the discoverers could supply in its crude state. Judging from the price offered, we should suppose that the mine must yield chiefly metallic or native antimony—an exceedingly rare occurrence. The sulphuret of antimony is the only ore of that character that has heretofore possessed any great commercial importance. This mineral is often found incidentally associated, as a sulphuret, in the ores of silver, copper and mercury, as in Humboldt, Nevada, where its presence is a great hindrance to the working of ores; but it is exceedingly rare as the prevailing product of a metaliferous vein in any part of the world. Native antimony is still of more rare occurrence, and is present in veins only in very small quantities. We are not aware that this metal is worked anywhere in the United States. There are a few unimportant mines of it in Europe, but the chief supply of the world is derived from the island of Borneo. Antimony is largely employed as a constituent in such alloys as type metal, habbit metal, britannia ware, pewter, etc.; its oxyds are also used to some extent in medical preparations. This metal was first extracted for commercial purposes about the close of the fifteenth century. Should the Virginia mine yield large quantities of the native metal, or should it even prove a heavy vein of approximately pure sulphurets, the profits of the fortunate discoverers may rival those of the richest silver mines of Washoe, or even the richest oil wells of Pennsylvania. It would scarcely seem possible that the geological position of petroleum, as generally understood, could be mistaken for one where antimony, or any of its associate minerals, should be found.

IRON *vs.* STEEL GUNS.—In the present attitude of our country, when the slightest accident may plunge us into a war with any one or two of the powerful European nations, it be comes a matter of no small moment to carefully consider our "situation," and capacity to meet such an enemy. Unlike our domestic war just closing, a foreign war must be for supremacy upon the ocean, and the first subject to be considered is consequently the condition of our naval armament. Competent engineers have had this matter under advice, and the result of their deliberations seems to be that in cast-iron guns we are superior to both the English and French; but in wrought-iron and steel guns we are inferior. These latter are the guns which in any future war must decide the fate of armor, whether upon ships or fortresses.

THE MAGNESIUM LIGHT.—The magnesium wire light is something extraordinary in its illuminating power. Much difficulty has heretofore been found in exploring and properly appreciating the vastness of the dark chambers of the Egyptian pyramids. The magnesium light, however, has recently been brought to the aid of explorers with great effect. A recent letter from Prof. Symth, now engaged in such exploration, alludes to the advantages of this light as follows:

With any number of wax candles which we may have yet taken into either the king's chamber or the grand gallery, the impression left on the mind is merely seeing the candles and whatever is very close to them, so that you have a small idea whether you are in a palace or a cottage; but burn a triple strand of magnesium wire, and in a moment you see the whole apartment and appreciate the grandeur of its size and the beauty of its proportions. This effect, so admirably complete, too, as it is, and perfect in its way, probably results from the extraordinary intensity of the light, apart from its useful photographic property, for, sids by side with the magnesium light, the wax candle flame looked not much brighter than the red granite of the walls of the room.

BISHOP KIP, of California, is spending the Winter at Cannes, France, Lord Brougham's favorite place of resort.

Extracts from the Statutes.

The attention of companies who desire advertising their delinquent sales in any other paper than that in which the notice of assessment appears, is called to the following section of the law approved April 4th, 1864:

Section 7. If any portion of the assessment mentioned in said notice shall remain unpaid on the day specified therein for the publication of the notice of sale, the Secretary shall, *unless otherwise ordered by the Board of Trustees*, cause to be published in the same papers in which the notice provided for in section five shall have been published, a notice substantially as follows, &c.

If, from a matter of convenience or necessity, the publication of an assessment is delayed, a very simple remedy is found in the following section of the law, relating thereto:

Section 14. No assessment duly levied shall be rendered invalid by a failure to make proper publication of the notices hereinbefore provided for, nor by the nonperformance of any act required to be performed in order to enforce the payment of the same; but in case of any substantial error or omission in the course of proceedings for collection, all previous proceedings, except the levying of the assessment, shall be void, and publication shall be begun anew.

The Kanawa, Va., Oil Regione.

The Burning Springs are on Burning Spring creek, a tributary of the little Kanawa, a little stream putting into the Kanawa about two miles north of Burning Springs. Oil has been struck in every instance where a well has been sunk. Riding along the road, one can see old derricks half destroyed by the rebel General Jones in 1862, when his great raid through here was made, awaiting repairs to be put upon them this Spring. The first well on the road is a flowing one, from which the owner has but to barrel oil from a tank and take life easy, while wealth comes flowing from the bowels of the earth at every ebb and flow of the tide. There are scores of wells along the ravines, which resemble in a great measure Oil Creek. The stream is a muddy, crooked, shallow affair, with hills rising high on either side. The mud here is deep beyond description. Derricks, tanks, receivers, engines, engine houses, and piles of empty and filled barrels, are so thick that the view up, down or across the ravine is greatly obstructed. Six ox teams now in the spring are slowly tugging at great loads of oil, till their eye-balls seem almost ready to start from the sockets, while muddy drivers with long whips crack their lashes, yell and swear till one almost imagines there is a taint of brimstone mixed with the petroleum-laden air.

The people are dirty—the teams are dirty—the houses, such as they are, look as though rolled in dirt, and the children wallow like pigs in the mud. There are scores of wells on this creek, and scores more going down as fast as machinery will do the work. The upper waters of Barning Spring creek, Reedy creek, Spring creek, the Two runs, Riffle run, and all the section within the great oil belt which reaches across Gilmer county, south of here, is full of oil. In fact, on the line of the belt south of Burning Springs, in every instance where a well has been put down, from sixty-four to two hundred and fifty-seven feet oil has been obtained. The largest yield from any one well here is claimed to be five thousand barrels a day, but on careful inquiry the facts came out that the greatest run was twenty-three hundred barrels a day. Quite a difference, but still a profitable well. The next largest well yielded twelve hundred barrels a day. Both these, with all the others on the stream, were filled up by order of Gen. Jones, but are now being opened again. Three new wells have just been struck here. One yielded one hundred and ten barrels the first day of pumping, before the pumps were in perfect order, and realized on the spot eleven hundred dollars profit to the owner for the day. Men bore on the waters spoken of with certain assurance of finding oil, almost equal to the certainty of finding seeds on cutting into an apple.

There are numerous springs on the waters of the different forks of Burning Spring creek, Reedy creek, Straight creek, etc.; while the surface show in some places where the oil oozes from crevices in the upheaved rocks are almost sufficient to pay for gathering without sinking wells. A portion of Wirt, Boone and Gilmer counties, coming within the oil belt, will prove the great oil territory of the world. Large numbers of operators are coming here from Pennsylvania and other States. Men of experience say the indications are better here than in any other State of the Union for vast yields of petroleum; and developments are daily proving the oft repeated assertion.

The owners of the land about this little village of four hundred regular inhabitants are rich beyond comparison. The royalty from the wells is making millionaires of them, while those who operate on leased lands will also do well.

Death of Richard Cobden.—The telegraph has announced the decease of Richard Cobden, a prominent English statesman, of liberal principles, and one of America's warmest European friends. It was mainly through his exertions that the repeal of the English corn laws was effected; and for his efforts in that direction his grateful countrymen raised, for his benefit, the princely sum of $350,000. Mr. Cobden was a self-made man, and attained the eminence to which he rose solely by his own exertions and his devotion to liberal principles. Amid the greater calamity under which the American people are now bowed down, they will not fail to mingle a tear of sympathy, also, with their English friends, who have thus suddenly been called to part with one who was ever the poor man's friend, and an earnest and eloquent advocate of liberty and progress in every part of the world.

Delayed Correspondence.—The letter from our attentive Grass Valley correspondent was accidentally mislayed, in the haste of removal, last week, and did not turn up until too late for insertion to-day. It will appear next week.

Peculiarities of Oil Wells.—There is nothing more uncertain than an oil well. If it graciously chooses to do so, it yields oil in great or small quantities; but if its will be perverse, no amount of coaxing will draw out the oleaginous treasure. Neither can it be safely predicted that a well which yields a dozen barrels to-day will yield one to-morrow. They have a well in Athens county, Ohio, says a correspondent of the Cincinnati *Gazette*, which, when sunk to the oil rock, suddenly spouted forth such a stream of oil as to threaten the oleaginous overflow of all that country. But after a short time the flow subsided, and from the reservoirs lustily constructed in the ground, 100 barrels of oil were afterward collected. Since that there has been but one well that "blows," as the workmen express it. That well, soon after being opened, began to throw out oil to the hight of twenty feet, but only for a short time. Last Summer, for a considerable time, it observed a regular period of twenty-four hours between these "blowings," each day the phenomenon occurring half an hour later than on the preceding day. At last, when the time for its "blowing" reached far into the night, it lost its regularity, and now seems to be governed by no law, but still keeps "blowing" almost daily. When supplied with a pump and engine, it stubbornly refused to yield at all, and the engine and pump were taken away, and the well resumed its "blowing." From another well nothing was got for several weeks but water. After being sunk, and giving the usual indications of oil, it was tubed and prepared for pumping. To the dismay of the company, only water was obtained as the result of the first day's work. Water abundantly flowed the second day, but no oil. The third day was but a repetition of the first two, and the well was about to be abandoned. One member of the company, however, suggested the idea that the water might be exhausted by constant pumping, and that then oil would be obtained. Being an obstinate man, his counsel prevailed, and day and night, without ceasing, the tireless engine pumped water, a whole fortnight; still no oil. Another fortnight, and only water appeared; another and another, when lo! the flow of water ceased, and the flow of oil began. Eight weeks of constant clinging to a theory brought a triumph to the obstinate member, and a reward to the whole company. On one occasion since, when for some reason the engine was stopped for half an hour, it required nearly twenty-four hours pumping to clear off the water. Again, when a belt broke and caused a stoppage of fifteen minutes, the same thing occurred. The well is now kept constantly running, and produces from twelve to fifteen barrels a day.

Music as a Physical Agent.—It communicates to the body shocks which agitate the members to their base. In churches the flame of the candles oscillates to the quake of the organ. A powerful orchestra near a sheet of water ruffles its surface. A learned traveler speaks of an iron ring which swings to and fro to the murmur of the Tivoli Falls. In Switzerland I excited at will, in a poor child afflicted with a frightful nervous malady, hyeterical and catalyptic cries, by playing in the minor key of E flat. The celebrated Dr. Bertier asserts that the sound of a drum gives him the colic. Certain medical men state that the notes of the trumpet quicken the pulse and induce slight perspiration. The sound of the bassoon is cold; the notes of the French horn, at a distance, and of the harp, are voluptuous. The flute played softly in the middle register calms the nerves. The low notes of the piano frighten children. I once had a dog who would generally sleep on hearing music, but the moment I played in the minor key he would bark piteously. The dog of a celebrated singer whom I knew would moan bitterly, and give signs of violent suffering, the instant that his mistress chanted a chromatic gamut. A certain chord produces on my sense of hearing the same effect as the heliotrope on my sense of smell and the pineapple on my sense of taste. Rachel's voice delighted the ear by its ring before one had time to seize the sense of what was said, or appreciate the purity of her diction. We may affirm, then, that musical sound, rhythmical or not, agitates the whole physical economy—quickens the pulse, incites perspiration, and produces a pleasant momentary irritation of the nervous system.—*Gottschalk.*

The Northampton *Press* says a business man of that town exercises his benevolence in distributing turkeys to his employees without much detriment to himself. If they can take the oath he prescribes he will give each one a turkey. But the oath is that they have not cheated him on time to an extent of twice the value of the turkey. The oath is said to prove a regular iron-clad, and thus he has kept his birds on the etrength of it.

Petroleum in Mexico.—It is stated that petroleum has been struck in Guadaloupe, one league from the city of Mexico.

The Amador, of Amador.—We are under obligations to Isaac Sherman, Esq., Postmaster of Amador, for a number of very fine specimens from mines in his neighborhood, among them two from the great Amador ledge. One of these was taken from near the surface, and shows it to be rich in chloride ore; the other is from a depth of 260 feet, and is almost a pure sulphuret ore. It is estimated that the latter piece will assay as high as $3,000 per ton. We expect it is a choice selection, but as it is of several pounds' weight, it shows that such ore exists in considerable quantities. The incline is six feet square, and is all within the ledge, the wherenbouts of the foot wall not being known, proving that the lode is over six feet in thickness. Every pound of rock taken out is carefully saved, and is valuable pay rock. One of Hansbrow's pumps is used in draining the mine, and furnishes a stream that is sufficient to supply two twenty-stamp mills. There are many other large lodes in that district, that, if developed, would undoubtedly prove as good as the Amador, but if only that one existed, its size and value would insure the prosperity of a large mining community.—*Reese River Reveille.*

Let it be Known.—When any of our readers respond (by letters of inquiry or by the purchase of articles) to advertisements found in our columns, they will confer a favor, not only upon us, but upon the advertiser, by mentioning the fact of having seen the notice in our paper.

To Mining Companies.

A gentleman who has had many years experience in Mining Superintendence, wishes employment in a first-class mine as Superintendent. The most satisfactory references given. Enquire at this office. 16v10-1f

Furnished House Wanted.

Wanted to rent, a house containing about six rooms. Will rent or purchase the furniture of such a house. Enquire at the Office of the Mining and Scientific Press, corner of Clay and Sansome streets.

HENDY'S IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Pateatee's price, by sending your orders, by mail or otherwise, at the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the Press of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$6.00.

Sent by mail, if desired. Address

DEWEY & CO.,

16v10-tf No 505 Clay street, San Francisco.

TO CAPITALISTS.

A Rare Chance for Profitable Investment.

The writer is in possession of a COPPER CLAIM, of 1,500 feet, located in Rough & Ready District, Tuolumne county, on which a shaft has been sunk to the depth of sixty feet, which is well timbered, curbed and covered, with everything necessary to the immediate prosecution of work. Also, a DWELLING HOUSE. The lode is regular and well defined, a great part of the ore from which would be classed as second quality, or No. 2. Both Thomas and J. Hardy own in it, and could be consulted as to its merits before visiting by any parties desiring to do so. I wish either to sell or get it worked on shares, and will offer superior inducements to any one desiring to invest. Apply at

MINING AND SCIENTIFIC PRESS OFFICE,

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permaneatly established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

The Golden Era is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

[Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the Golden Era are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by Pierce Egan, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "The Fair Lilias; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

Take care to write distinctly the name of the person, the name of the city, town or locality where the post office is situated, and the name of the County and State, in order that the paper may be fully and accurately directed to every address.

AGENTS in every part of the State receive subscriptions for the Golden Era.

POSTMASTERS in California, Oregon, and neighboring Territories obtaining subscriptions for the Golden Era and forwarding the same, with name and address of the subscriber, will be allowed a very liberal commission therefor.

BROOKS & LAWRENCE,

Golden Era Building,

No. 543 Clay street, near Montgomery, San Francisco.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief thereto.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,

By G. C. Letcher, Deputy Clerk.

C. Sims, Attorney for Plaintiff. 7v10-3m

ORATORY.—In oratory, the great object seems to be to produce an excitement by noise and personal display, rather than to instruct the understanding; and in times like these, where oratory is most needed, it is most dangerous when employed to get up an excitement rather than to regulate and guide the unavoidable excitements of the hour. A very neat comment was made a few days ago by an editor of a paper, on a public discourse to which he had listened the evening before. He said: "We were quite refreshed by listening to a *man speaking* instead of a man making a speech. We have had too much of the latter long ago."

ANSWERING THE QUESTION.—Gov. Oglesby, of Illinois, who is a Kentuckian by birth, in his annual message answers the question, what is to become of the negro? in this way: "He can labor, he can learn, he can fight, improve and aspire, and if, after we shall have tried, for as long to make him a useful man as we have a useless slave, we shall fail, and he shall fail, there will be time enough left in which to solve this persistent question."

FISH AND THE DROUTH.—The Napa *Reporter* says that the streams in the vicinity of Napa, which have heretofore abounded in trout, are now almost destitute of that favorite species of the finny tribe. The drouth of last year, and the Chinese with their seines this year, did the business for them, and now they can only be found high up in the mountains, out of the way of Chinamen and the drouth, where it would hardly pay to seek them.

GREAT DEMAND FOR ENGINES.—It is stated that the Webster Machine Company, of Patterson, N. J., have entered into contracts to deliver, at various points in the Pennsylvania oil regions, one portable engine per day for six months.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

Metallurgy.

METALLURGIC INSTITUTE,
McKibbin's Railing Works, First St., Up Stairs
SAN FRANCISCO.
Practical Instruction in ASSAYING by wet and dry methods, Roasting of Silver and other Ores by various methods, according to the character of the ore, Amalgamation, Smelting of rich Silver and Gold Ores, Refining of Silver and Gold-bearing Lead, Blow-pipe Assays and Analysis. TERMS LOW. Chloration of Auriferous Sulphurets taught at an extra charge.
Young Gentlemen desiring a knowledge of the principles as well as the practice of Metallurgy, Mine Surveying, Topographic and every kind of Mechanical Drawing, accepted for a long term at $300. Hours of Instruction—From 9 A. M. to 4 P. M.
REFERENCES—The first Mining Engineers and Metallurgists on the Pacific coast.

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

THE BANK OF ENGLAND.—The Bank of England was born in just such troublesome times as those upon which we have fallen. It is the child of the English Revolution in 1688. Wm. Patterson, a shrewd Scotchman, of whom his friends said he had been a missionary, and his enemies that he had been a buccaneer, proposed the formation of a joint stock company, whose object should be to loan its funds to the Government. Parliament accordingly chartered the company in 1691, under the style of the "Governor and the Company of the Bank of England," limiting its capital stock to $6,000,000 (we reduce the pounds to dollars), all of which it might loan to the Government at eight per cent. annual interest, and receive also from the Government $20,000 a year for expenses of management. The books were opened, and, to the surprise of everybody, all the stock was immediately subscribed for. The Bank of England commenced operations by investing its whole capital in Government debts; in other words, it loaned $6,000,000 to the nation at eight per cent., and was to receive $20,000 per year besides.

Old Stand, corner of Bush and Market streets, opposite Orlenial Hotel, San Francisco.

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

4v10

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAKELEE,
O. OORI, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

REMOVAL.

The Office of the

Rose Gold Mining Company

Has been removed to No. 338 Montgomery street, Athenæum Building (Room No. 12), southeast corner Montgomery and California streets. [9v10-4t] C. M. PECK, Secretary.

SALT MINES.—The salt mines of Cracow were discovered in 1251. The length of the mines from east to west is above 6,000 feet; the breadth from north to south above 2,000, and they are 800 feet in depth. When a stranger wishes to visit these mines, he is habited in a suit of miners' clothes, and let down a perpendicular descent of 600 feet. The place is very dark, and the miner, who descends as a guide, strikes a light and conducts the stranger forward, through several gloomy winding passages, at the end of which they descend by ladders 200 feet lower into a larger cavern; through this cavern they enter upon an open plain, peopled by the miners and their families, together with their horses, dogs and other domestic animals. Nothing can exceed the brilliancy of this place; illuminated by thousands of lamps, reflecting their light upon the beautiful and transparent surface of the salt in every varied color.

A NEW SAFETY LAMP.—M. Alphonse Dumor, of Paris, has invented a new safety lamp, in which a phosphorescent light is used. The advantages of such a light are that it gives a cold light, and it can, therefore, be used in places where the use of the Davy Lamp might be attended with danger. The light is obtained by an electrical battery, and it is said to cost but 1d. for ten working hours. The principle of the phosphoric light is not entirely new.

WOLVES.—Central Europe seems to be more afflicted with the ravages of wild beasts than is the country between here and the Mississippi. Cold and hunger have, during the past Winter, driven wolves in large numbers from Poland into Prussia and Silesia, where they have inflicted much damage by destroying cattle.

COAL UNDER THE SEA.—Coal has been gathered up on the beach at Phippsburg, Me., for many years, and Professor Brackett, of Bowdoin College, thinks that a coal mine extends along the coast from Rhode Island to Nova Scotia, but that the bed of the coal is too far out at sea to be worked. The waves cast blocks of it upon the beach from time to time.

A STATUE of Alexander Hamilton, the greatest of the early statesmen of America, will soon be erected in some one of the prominent streets of Boston. It will soon be ready to set up, and it is pronounced one of the first among similar works of art.

WE have now nine Territories waiting to be made States. They are: Wyoming, Arizona, Colorado, Idaho, Montana, Nebraska, New Mexico, Utah and Washington.

A NEVADA INVENTION.—The Scientific American reports the patenting of an invention of W. F. Stewart, of Austin, of an improved mode of working silver ores and saving amalgam and quicksilver. Frank Stewart resided temporarily in this city about a year ago, and often mentioned that he had a process by which all amalgam and quicksilver that was then wasted could be saved. He never vouchsafed us an explanation; but we inferred that it was a chemical preparation. At that time there was great loss at the mills complained of by the miners, which, we think, does not occur to-day, although ores of the class worked then are worked now by nearly the same process, but cheaper. There is still some loss of quicksilver, and, without doubt, amalgam, which, probably, this invention may save; if so, and it can be done cheaply, Stewart can make the fortune we really wish him to possess. His residence, however, is San Jose, Cal., and not Austin. We think he would have brought his invention into notice much sooner by doing his patenting business through the office of the MINING AND SCIENTIFIC PRESS of San Francisco rather than the Scientific American of New York. For hat, he deserves a newspaper lick from some one. The MINING AND SCIENTIFIC PRESS is a paper that all citizens of the Pacific coast should be proud of, and those connected with mining particularly should give it their support. As a mining journal and instructor, it is far preferable to the Scientific American, although that paper leads all others in its specialty of mechanical engineering.—[Reese River Reveille.

Worth Considering.—Advertising has proved the medium of success to many of the most prominent business men of the world. Merchants, Inventors, Builders, Patentees, Manufacturers, Foundrymen, Machinists, and, in fact, all who wish to call the particular attention of the Mining, Professional, Mechanical and Industrial members of the community to their business, should not fail to advertise in the MINING AND SCIENTIFIC PRESS. The circulation of the paper is extensive, and has a wide range, reaching the most intelligent readers in every mining settlement of importance on the coast. A large number of copies are also sent East. Our terms are reasonable. "Live and help live" we believe to be a sensible motto.

NOW IN ITS TENTH VOLUME.
—THE—
Mining and Scientific Press,
—THE MOST—
Profitable Newspaper
—FOR THE—
Readers of the Pacific Coast.
Issued Every Saturday Morning.
DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the PRESS furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,
And a Helpmeet to All Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SAN FRANCISCO
CORDAGE MANUFACTORY.
CONSTANTLY ON HAND,
A Large and Complete Assortment
—OF—
MANILA CORDAGE,
FOR MINING PURPOSES.
—ALSO—
WHALE LINE, BALE ROPE, ETC.,
Manufactured from Pure Manila Hemp.
Hoisting Ropes for Deep Shafts,
—ALSO—
Lines for Ferry Boats,
Manufactured to Order.
Office at TUBBS & CO.'S,
Nos. 611 and 613 Front street.
Manufactory at the Potrero. 14v10

Machinery.

VARNEY'S
PATENT AMALGAMATOR.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY,
1v10 San Francisco.

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood,
ALSO, THE
Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

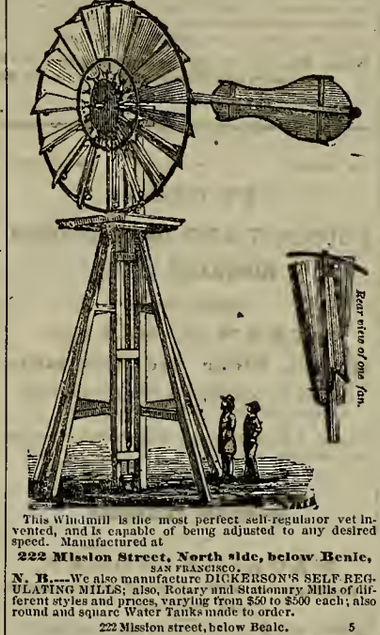
ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

HUNT'S NEW DITCHER.



HAVING SECURED FROM THE INVENTOR THE SOLE right to manufacture these Machines for the States of California and Oregon, and the Territory of Washington, I am now prepared to receive and promptly fill orders for these machines.

With the aid of three men and four horses this Machine will cut a ditch from two to three feet deep, as may be desired, dumping the earth all on one side so as to form a dike or embankment. For particulars send for circular, to

E. O. HUNT,

Windmill Builder, No. 28 Second Street and 110 & 112 Jessie Street, San Francisco. 9v22tf

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lumbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay.....	250	943	Assay	300
Assay.....	286	941	Assay for Czotman	980
Assay.....	286	940	Assay Water Rock	966
Assay.....	291	950	Assay Water Rock	908
Assay.....			St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Orinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.
1 Golden State Iron Works, San Francisco.

TO QUARTZ MINERS.
Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,
At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15v1m

PRATER'S
PATENT CONCENTRATOR.

THE PROPRIETORS OF THIS NEW CONCENTRATOR, having completed arrangements for its manufacture at the Fulton Foundry, in this city, now offer it to the public, with the fullest confidence that for the purpose for which it is designed

It Has No Equal in Use.

The principle of this machine, which is designed for a Concentrator exclusively, is entirely new. It is designed for separating finely divided quicksilver, amalgam and gold from the sands, and for concentrating and saving the sulphurets, and is to be placed behind all or any other machine in use.

This machine is now running on waste sands, from which it is taking out an average of 3½ pounds of quicksilver for each ton of sand. Orders or letters of enquiry may be addressed to

HUNOERFORD & PRATER, Proprietors.
San Francisco, April 1st, 1864. 14v8tf

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v3

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. B. FAUCHERY, Engineer,

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Saturday, the 5th day of May, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD FLANAGAN, Secretary.

Office, No. 606 Montgomery street (up stairs), San Francisco. apr25

Cholar Copper Mining Company, McCourtney District, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of March, 1865, an assessment of $7.70 per share was levied upon the capital stock of said Company, payable on the 19th day of April, 1865, in United States gold and silver coin, to the Secretary, at his office, 611 Clay street, San Francisco, or to C. C. SMITH, Grass Valley.

Any stock upon which said assessment shall remain unpaid on Saturday, the 20th day of May, 1865, will be advertised on that as delinquent, and unless payment shall be made before, will be sold on Monday, the 5th day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, Room 8, No. 611 Clay street, San Francisco. apr22

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of Edwards, Olney & Co., No. 826 Montgomery street, San Francisco, on the 8th day of May, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. S. BROWN, Secretary,
Per J. WARREN CLARK, Deputy.

Office, 430 Montgomery street, San Francisco. apr22

Constitution and By-Laws

—OF—

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the **Mining and Scientific Press.**

☞ Orders from the interior faithfully attended to. Packages which can be judiciously sent by mail will be prepaid at our expense.

RAILROAD *vs.* CANAL.—A San Francisco contractor, named Brooks, has offered to build a railroad from Petaluma to Healdsburg, in Sonora county, on fair terms. The distance is about thirty-three miles. In the opinion of the Stockton *Record*, a canal, to be fed by the Cainamero, or Russian river, would be of far greater benefit to that section of country than a railroad.

THE proposed railroad from Marysville to Portland, Oregon, if built, will be 650 miles long, and will cost $3,500,000. Congress has passed a bill in aid of its construction, and two companies—one in each State—have been incorporated to carry out the work.

IT is said that an Eastern Emigrant Aid Society has sent an agent to this coast to ascertain how many of the surplus women of that section can be provided for on the Pacific. For the benefit of our bachelor readers, we will state that "being provided for" includes a husband.

Memorandum for Secretaries.

Safe Rules for Advertising.

Make your order levying the assessment on any day EXCEPT FRIDAY, and advertise the Assessment Notice on the FIRST FOUR succeeding SATURDAYS, setting the day for delinquent advertising on the FIFTH SATURDAY, and the day of sale on the SEVENTH SATURDAY, or any day thereafter, PREVIOUS to the EIGHTH SATURDAY.

ADVERTISING IN THE INTERIOR.—If the mine or works of the corporation are located in any State or Territory of the United States, notice must be advertised there also, if a newspaper is published in the same county. On this account, SATURDAY is the best day on which to levy assessments, as thereby the longest period possible is gained for transmitting a copy to interior papers, which are usually published on Saturdays.

POSTPONEMENTS.—The date set for advertising delinquent stock, and the day of sale mentioned in either notice, may be *once* postponed for any period not to exceed ten days. Secretaries can avail themselves of this privilege when assessments are levied on Friday and they are obliged to advertise at the mine on Saturday, or desire to publish on that day at the place of incorporation.

ERRORS, OMISSIONS, OR DELAYS are definitely provided for in Section 14 of the new law, whereby it is plain that, if the advertising is delayed, the Secretary can only fix the dates for delinquent advertising and sale to suit the time he is to advertise, and proceed anew.

WHEN PAYABLE.—It is the usual custom to make the assessment "payable immediately," or upon some date within a day or two from the time of levying the assessment, although the law makes no requisition as to this matter.

BLANKS FURNISHED FREE to advertisers in the MINING AND SCIENTIFIC PRESS, for Assessment Notices, Delinquent Sales, Postponements, etc.; also copies of the Assessment Law of 1864. Copies of advertisements, for sending personal notice to shareholders, printed at $1 per hundred.

The PRESS is the most ECONOMICAL advertiser for stockholders, reliable and obliging for Trustees and Secretaries, and merits the patronage of the mining interests.

Correct blank forms for advertising, and any information desired by advertisers, will be furnished, gratuitously, at the office of the MINING AND SCIENTINIC PRESS.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

UNASSESSABLE.

First National
PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON,
W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 543 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Mining Notices--Continued.

Antelope Silver Mining Company—Office, No. 522 Montgomery street, San Francisco.

The regular Annual Meeting of the stockholders of this Company will be held at the office of the Company on Monday, May 1st, 1865, at 2 o'clock P. M. By order of the President. JOHN S. MACKENZIE, Secretary.
San Francisco, March 31, 1865. apr1-4t

Bella Vista Gold and Silver Mining Company, Cacachilas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 10th day of April, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable on the 11th day of April, 1865, in United States gold coin, to the Secretary, at the office of the Company, 326 Clay street, in the city of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 13th day of May, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 27th day of May, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
J. FULLER, Secretary.
Office, 326 Clay street, San Francisco. apr15

Chipioneua Silver Mining Company, Urez District, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of April, 1865, an assessment of two dollars per share was levied upon the Capital Stock of said Company, payable on the 17th day of April, 1865, in United States gold coin, to the Secretary, at office of the Company, No. 318 California street, in the city and county of San Francisco.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 20th day of May, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 3d day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
JOHN F. LOHSE, Secretary.
Office, No. 318 California street (up stairs), San Francisco. apr15

Consolidated Silver Hill Mining Company
Office, No. 522 Montgomery street, San Francisco.

The regular Annual Meeting of the stockholders of this Company will be held at the office of the Company, on Monday, May 1st, 1865, at 4 o'clock P. M. By order of the President. JOHN S. MACKENZIE, Secretary.
San Francisco, March 31, 1865. apr1-4t

Chihuahua and Western Summit Mining Company, Esmeralda District, State of Nevada.

Notice is hereby given, that a Stockholders' Meeting of this Company will be held at the Company's office, No. 435 Jackson street, San Francisco, on Monday, May 1st, 1865, at 11 o'clock A. M., for the purpose of electing officers for the ensuing year. W. L. BROMLEY, Secretary,
No. 436 Jackson street.
San Francisco, March 31, 1865.

Comstock Gold, Silver and Copper Mining Company, San Antonio District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of March, 1865, an assessment of $2.50 per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at room No. 9 Mercantile Library Building, San Francisco.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 13th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
CHAS. H. PLATT, Secretary.
Office, Room No. 9 Mercantile Library Building, N. E. corner Bush and Montgomery street, San Francisco.

N. B.—The above assessment is levied for the months of March and April—one-half the amount ($1.25) payable immediately, and the balance on or before the 29th day of April next. (mar25) CHAS. H. PLATT, Secretary.

Daniel Webster Gold and Silver Mining Company, Sacramento District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of March, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 29th day of March, 1865, in United States gold coin, to the Secretary, at his office in San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 29th day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 17th day of May, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.
JOHN J. SOOTCHLER, Secretary.
Office, No. 204 Front street, San Francisco. apr1-5t

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

Notice is hereby given, that a Meeting of the Stockholders of the Evening Star Gold and Silver Mining Company will be held at the office of said Company, No. 710 Sansome street, San Francisco, on Monday, the 24th day of April, A. D. 1865, at 3 o'clock P. M. of that day, for the purpose of altering and amending the by-laws of the Company. [14v10 3t] N. DUPERU, Secretary.

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpino county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 11th day of March, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Trustees, made on the 11th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of the Company, by Edwards, Olney & Co., on the 1st day of May, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. L. KIRBY, Secretary.

Office, No. 611 Clay street, Room No. 8, San Francisco. apr15

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 18th day of March, 1865, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to H. D. SCOTT, Superintendent, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on Saturday, the 22d day of April, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 6th day of May, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. S. BROWN, Secretary.

J. WARREN CLARK, Dept. Secretary.

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

W. H. TOBEY & CO., Box 2021 Post Office.

MINING BLANKS

For Sale

AT THE

OFFICE OF THE MINING AND SCIENTIFIC PRESS,

No. 505 Clay Street, corner of Sansome.

Blanks for Mining Companies, Secretaries, Shareholders and others, always on hand, or printed to order, at our office.

Among others are those of the following forms:

Shareholder's Proxy.

Know all men by these presents, that I, ... do hereby constitute and appoint ..... my attorney and agent, for me and in my name, to vote as my proxy, at a meeting of the ..... Mining Company, to be held ..... 186 , according to the number of votes that I should be entitled to cast were I there personally present.

In witness whereof I have this day hereunto set my hand and seal. .....[Seal]

Dated 186

Assessment Notice.

..... Company

....

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ..th day of ..... 186 , an Assessment of .....per share was levied upon the Capital Stock of said Company, payable on the ..th day of .....186 , in United States gold and silver coin to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the ..th day of ....., 186 , will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on ....., the ..th day of ....., 186 , to pay the delinquent Assessment, to gether with the costs of advertising and expenses of the sale. By order of the Board of Trustees.

..... Secretary.

Office.....

Delinquent Sale.

NOTICE.—There are delinquent, upon the following described Stock, on account of assessment levied on the ..th day of ..... 186 , the several amounts set opposite the names of the respective shareholders as follows, to wit:

Names.	No. Certificate.	No. Shares.	Amount.
Theophilu Tbistle	23	14	$140 00
Peter Pipe	2	3	30 00

And in accordance with law and an order of the Board of Trustees, made on the ..th day of ...., 186 , so many shares of each parcel of said stock as may be necessary, will be sold at the.....

....., on ....., the ..th day of....., 186 , at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

..... Secretary.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.
2. Certificate of Notary that A. B. is Recorder of District.
3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.
4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

v9-19 SAN FRANCISCO.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

THE vines at Anaheim and Los Angeles have been frost bitten. All the young shoots have suffered. Whether they will recover from the injury is doubtful. It is supposed that, at the worst, there will be at least half the ordinary crop. This is said to be the first time since the American conquest that the grape vine has suffered by frost.

A Query Answered.

EATONS MINING AND SCIENTIFIC PRESS:—As a constant and attentive reader of your valuable paper, I address a question of great importance to you, to wit:

Is it true that Congress at its last session passed an act authorizing the sale of mineral lands at $20 per acre, or authorizing anybody to locate on mineral lands and secure the Government title to the same, by paying $20 per acre for them?

Please give this subject the consideration which its importance deserves, and inform the mining community through your columns whether such an Act has been passed, and if so, what steps are to be taken to conform to the same. I remain, with great respect.

A. E. MEYER.

Stockton, April 25, 1865.

In answer to our correspondent we would say that a bill was introduced, during the last session of Congress, providing for the sale of mineral lands under certain restrictions. We have not the bill before us; but according to our recollection it was framed with much care and judgment, and disposed of nearly every objection which has hitherto been urged against the sale of the mineral lands by Government. It provided that American citizens, alone, should have the right to purchase; that the actual occupant, or holder of any mining claim or piece of mining ground should have the prior right to purchase; that no amount of mineral land greater than *forty acres* should be included in a single purchase; that all the precious metals extracted should be coined or assayed at an United States Mint; and that all parties applying for purchase should take the usual oath of allegiance. The object of the measure was not to create any new or important source of revenue to the Government, but to give the occupants of mineral lands an opportunity to acquire a *bona fide* title to their ground at a nominal price, and put a termination to the endless amount of litigation, which the present system appears to unavoidable entail upon our mining property. The bill, we believe, was lost in the unfinished business of Congress; but from the favorable manner in which it was received both in Congress and by the press in this State we are inclined to think it will be brought up again early in the next session, with a very fair prospect of becoming a law.

AN ANÆSTHETIC.—Dr. Geages has addressed a note to the French Academy, giving an account of some interesting experiments in trying new agents for diminishing sensibility. He has ascertained that a purified kerosaline, obtained from common petroleum, when vaporized by means of heat, will be found a most valuable anæsthetic. But he especially commends, as safer than chloroform, *Bromhydric ether*, which is not only less inflammable than ordinary ethers, but possesses a most agreeable odor.

WHERE POETS ARE BURIED.—It is strange how many English poets have of late years lain down in foreign countries to die. Shelley and Keat are buried in Rome. Byron died in Greece. The Summer visitor to Boulogne, who turns aside into a quiet street beneath the old ramparts, comes upon the house where Thomas Campbell breathed his last. Elizabeth Barrett Browning is buried in Florence the Beautiful, and now Walter Savage Lindor lies dead in the same famous old city.

PATENTS RECENTLY ISSUED.

PROCESS FOR REFINING AMALGAM—To William Bruckner, of San Francisco. The inventor claims the use of bi-chloride of copper or its equivalent, together with iron pyrites and salt, without reference to the exact proportion of each ingredient, in the manner and for the purpose described.

QUARTZ CRUSHER.—To George R. Peterson of San Francisco. The nature of this invention consists in providing a machine for crushing ores, so arranged and constructed as to give the largest amount of strength where the greatest strain comes. The crushing is accomplished between two iron plates, faced with hard iron, and so arranged that they may be set so as to crush the ore to any desirable degree of fineness. We have already described this invention at length in a previous number. Both this and the invention above were patented through the MINING & SCIENTIFIC PRESS PATENT AGENCY.

GANG PLOW.—To L. Holloway, Gilroy, Cal. This invention relates to an improvement in that class of gang plows, in which the plows are attached to a separate frame, which connects by a hinge with a truck, so that by drawing the truck through a field the plows are caused to act on the soil to any desired depth.

HYDROSTATIC ENGINE.—Thomas Hansbrow and B. B. Redding of Sacramento. This invention has been fully described in past numbers of the MINING AND SCIENTIFIC PRESS. The patent was granted during the week ending March 14th, 1865.

PROCESS FOR SEPARATING GOLD AND SILVER FROM THEIR ORES.—Geo. N. Jennings, of Virginia City, Nevada. The inventor claims the use of ashes and charcoal as a flux in reducing quartz and other rock for separating gold and silver and other metals therefrom. He also claims an amalgamating solution, composed substantially as above described.

PROCESS FOR DESULPHURIZING AND DISINTEGRATING ORES.—Dr. James C. Ayer, Lowell, Mass. The inventor claims the treating of ore or rock, while in a heated state, with an alkaline or saline solution, for the purpose of partial disintegration and desulphurization and oxydation—also for re-treating the same, repeatedly until the process is fully completed.

MINING AND METALLURGY.—The California Mining and Metallurgical Company filed its certificate of incorporation in San Francisco on the 22d inst. Its objects are to carry on and conduct the business of mining and metallurgy in California and Nevada. Capital stock, $100,000 shares of $100 each. Trustees—Benjamin S. Brooks, Thomas B. Valentine, David B. Fraacis, Stephen F. Ambler and S. Dyckman Valentine.

THE Rappahannock and Santa Rosa Mining Companies, in Palmyra District, Nevada, after fighting each other at law for the last two years, to the great detriment of both parties, have at last come to terms, and effected a consolidation, dividing the stock equally between the two parties—each Company assuming its own depths and liabilities. The ledge, which was in dispute is the richest in Palmyra District as far as known.

"TELL you what, sir," said a Yankee of his opponent, "that man don't amount to a sum in arithmetic; add him up, and there is nothing to carry,"

THE OIL MARKET OPENED.—By reference to an advertisement in another column it will be perceived that a market has already been opened in this city for the purchase of crude petroleum. Pennsylvania petroleum was worth in New York, at latest dates, from fifty to fifty-two cents per gallon. The indications are that the crude petroleum of California, when it can be obtained from any considerable depth, will be worth a large per centage over that generally obtained at the East, on account of its superior lubricating qualities. We understand that parties in this city are prepared to purchase, to any extent, crude petroleum for transportation to Europe, as fast as it can be placed in the market. Our oil prospectors will therefore not be compelled to wait for the erection of refining machinery, but can realize, at once, from the article in its crude state. We are, moreover, authorized to state that parties holding the rights to manufacture, are prepared to turn out patent hermetically sealed barrels for holding the liquid, as soon as the demand for them shall arise.

EARTHQUAKE.—Quite a severe shock of an earthquake was experienced in this city on Wednesday last, at five minutes to four o'clock P. M. There were two distinct shocks, with but a few seconds intervening. The motion of the earth seemed to be "up and down" instead of in the usual rolling or waving style, and a sharp crackling noise accompanied the demonstration in many localities. The shocks were heavy enough to be generally felt throughout the city, but not so severe as many we have experienced the past two years.

ARIZONA MINING AGENCY.—By reference to an advertisement in another column it will be noticed that a general mining agency for buying and selling stock, in incorporated or unincorporated mining companies, in El Dorado Cañon and the Territory of Arizona, has been established at 338 Montgomery street in this city. The same parties are also prepared to contract for the delivery of freight as far as El Dorado Cañoa at the low rate of four and a half cents per pound.

COPPER SHIPMENTS.—Six hundred and thirty sacks of copper ore, seventeen sacks of matte, or crude copper, and eighteen pigs of smelted copper were shipped from Stockton on Friday of last week; on Saturday, sixty-nine additional sacks of ore were shipped, and on Monday last this amount was increased by 771 sacks of rough ore and twenty-four sacks of pulverized and concentrated ore. Of this latter shipment, 376 sacks were from the La Victorie mine, in Hunter's Valley, Mariposa county.

DURING a late debate in Congress it came out, on a motion to prohibit the importation of statuary in lead, that a house in New York has been in the habit of importing lead negroes, lead statues of liberty, and other lead dodges, in order to dodge the duty on "lead in pig."

TWO MAIL STEAMERS PER MONTH.—The Pacific Mail Steamship Company have withdrawn one steamer per month from their line, and consequently hereafter will despatch only two packets, one on the 3d and the other on the 18th of each month.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE AGE OF GOLD-BEARING ROCKS.

By THOMAS ROWLANDSON, Fellow of the Geological Society, London.]

NUMBER THREE.

RATIONAL OBJECTS SOUGHT BY A STATE GEOLOGICAL SURVEY.

The incidents recited in the episode which formed the subject matter of the preceding number forms an appropriate introduction to the consideration of the rational objects sought, by and may reasonably be expected from a properly conducted geological survey, respecting which there exist some very crude opinions amongst the general public, pretty plentifully sprinkled, with some very unreasonable ideas and disappointed expectations. To such as anticipated that a State geological survey would prove the ready and economical mode of indicating to adventurous prospectors where they could most certainly strike rich paying veins of precious minerals, or beds of mineral fuel, asphaltum, or deposits of mineral oil—any geological survey, however early and liberally, after discovery, its members might announce the facts which it had ascertained of this character—would prove a disappointment. To use the words of the State Geologist, he is "not employed as a prospector," a sentiment with which the writer fully concurs; in fact, the great economical advantage of geological knowledge rests more upon warning the mining adventurer where he ought not, than where he ought, to seek for mineral wealth. The latter in all cases is subject, notwithstanding the most satisfactory superficial indications, to great, extraordinary and sometimes most unexpected irregularities and disappointments, that could not by any means be reasonably anticipated *a priori* by scientific deduction, and only becomes explicable by practical working. The former statement may be illustrated by the almost innumerable fruitless efforts which have been made within the last few years in attempting to find copper in places where the veriest tyro in geology could have assured these reckless and unfortunate prospectors that there did not exist the slightest chance of success. Again, at the present moment high expectations are being held and much outlay made in seeking for oil in positions where the slightest examination by an expert of the surrounding strata would be conclusive that efforts made in such ill-selected localities would only terminate in disappointment and loss. It is not intended here to dwell upon what may reasonably be expected at the hands of geologists by affording assistance in the development of the undoubtedly great mineral resources of this and the adjacent States and Territories; a brief summary of such will be given at the conclusion of these papers. It may suffice for the present to observe that the practical teachings of geology, so far as mining is concerned, is more of a precautionary character than as inciting to adventurous outlay.

Perhaps the views here intended to be impressed upon the general reader will be better understood by the insertion of some practical illustrations, the first of which, although unconnected with metallic mining, is of a character which will make it very clear to the observant reader that there are cases where, notwithstanding all the surrounding surface indications are most favorable to a given set of conclusions, yet in practically working out the results sought, unexpectedly disturbing agencies may occur to completely frustrate any pre-conceived theory. For such unexpected disappointments every experienced geologist is always prepared. In mining for metals these perplexities more commonly take the form of unexpected heaves and downthrows, intersected by faults and irruptive trap, felspathic granite, etc., minerals. But, to our first illustration.

Owing to the increasing demand for water supply, the company known as the New River Company, the oldest and richest water company in London, purchased the Hampstead Works, situated at Kentish Town, London, which is 174 feet above the high-water mark of the Thames. After the purchase it was determined to bore for an artesian spring, especially as the practicability of the attempt had been demonstrated a few years previously by the one sunk at Grenelle, near Paris, which, after traversing 148 feet of the tertiary strata, and 1,394 feet of chalk, reached the lower greensand, from which a large and continuous supply has since flowed, capable of being raised 130 feet above the surface. At London, the conditions for a work of this description appeared more favorable than around Paris, for the lower greensand in England is much thicker than in France, and the outcrop is nearer to London than it is at Paris, and relatively higher. The most serious objection anticipated to the London enterprise was the possible greater thickness of the chalk to be passed through; but from observations made over the surrounding district, Mr. Prestwich, a most observant geologist, and now so well known in connection with the discovery of human remains in the drift near Abbeville, etc., calculated that probably not more than above 700 feet would have to be passed through, the actual boring showed 910½ feet, making a total of 1,235 feet from the surface, 324½ feet being through tertiary strata. All the beds anticipated were found in due succession, and there existed every reason to believe that the order which prevailed in the surrounding outcrops would continue at the point of boring. The ordinary probabilities of the geological sequence being maintained throughout this central area appeared to Mr. Prestwich so strong that, having to allude to the subject at the Institute of Civil Engineers, Mr. P. did not hesitate to express his conviction that a few more turns of the auger would tap the lower greensand. To fully comprehend how strong this conviction must have been, the reader should understand that Mr. Prestwich is an extraordinary cautious gentleman as respects giving any decided opinion respecting any matter on which the slightest doubt might exist. To sum up the history of this boring, it may be mentioned that it was continued down to 1,302 feet, the six last feet of which passed through a hard micaceous, light-colored sandstone, supposed to be horizontal. It unfortunately happened, for the economical success of the trial, that the sinking was attempted at perhaps as unfavorable a point as could be found within the wide area encircled by the outcropping greensand, originating in the circumstance of works having already been located at the spot; for Mr. Prestwich had previously indicated the low-lying ground of St. James' Park as one of the most favorable positions for the experiment. The difference, however, was not thought to be more unfavorable than that probably 200 to 300 feet additional boring would have to be performed, an extra charge which was not unfairly supposed to be more than compensated by the greater facilities and economies connected with making the attempt where machinery and works existed. Such a disappointment as that the attempt would utterly fail in cutting the lower greensand, or that if it was cut that its lithological characters would become so changed as to be utterly useless for the object sought, was never anticipated by any one, though now that the result is known, it is readily seen that far too little importance had been attached to the possible disturbance which might be occasioned in the underlying beds by the comparatively trifling elevation of Hampstead Hill. The instance detailed will satisfy any reasonable mind why geologists are so exceedingly careful in giving a positive opinion on any given question connected with their profession; and notwithstanding the disappointment, both scientific and economical, in the trial just detailed, disclosing as it did results contrary to every reasonable anticipation, yet geological research had previously indicated the possibility of such an occurrence, respecting which I cannot do better than quote Mr. Prestwich's own words, which are subjoined:

"The result of this important work is very unexpected, and presents great geological difficulties. It raises a question of much interest, both in a scientific and practical point of view, and it will require further careful inquiry and observation to enable us to determine to what series these red clays and sandstones may belong, the character of the strata passed through in place of the anticipated, ordinarily lower greensand, and thus estimate whether or not there is a probability of meeting with water-bearing strata at a yet greater depth. Do these red beds form an exceptional condition of the base of the Gault? Are they local beds of the lower greensand? Do they belong to the mottled clays and stones of the Wealden? Or are they to be placed with the new red sandstone? On the first three suppositions beds of water-bearing sands may yet occur; on the last, however, the chance of finding water would be more doubtful, although even then not altogether impossible.

"The lower greensand crops out with so much regularity both to the north and south of London, and skirts the Gault so continuously, that from a surface-examination of the ground there could be no apparent reason for supposing that the same deposit was not continuous underground, and would be met with beneath London. I must confess that I never contemplated the probability of any break in the order of superposition; but, although it may prove that my anticipations were wrong, still I would observe that geology had nevertheless indicated the possibility of other conditions; for Mr. Godwin Austin, taking a *wider* field of observation, and basing his deductions upon phenomena carefully studied in Belgium and the west of England, came to the remarkable conclusion that the axis of the Ardennes (Belgium) was prolonged under the cretaceous series of the south of England, and re-appeared again on the surface in Somersetshire (the Bristol coal-field); and he inferred that it was probable that the coal measures might be found under part of the London tertiary and Wealden districts. The evidence adduced by Mr. Austin is of that nature that I am prepared to admit the possibility of such a case, and therefore consider the phenomena presented by the Kentish Town well, must be taken into consideration with his ingenious hypothesis."

Since the above was written Mr. Austin has adduced additional evidence of the soundness of his theory, rendering it probable that some day workable coal may be economically obtained from some portions of the London basin. The unscientific reader will easily gather from the details just given how desirable it will generally be found that before forming any decided opinion on subjects embraced in the domain of geology, that extended and minute enquiries should be instituted, and not to base important deductions on superficial and very local observations.

Having given an instance where geology has been at fault in some measure, though not altogether, even where the general surroundings were such as to justify very sanguine expectations, in the next number will be noticed some instances of gross mismanagement and loss in mining matters, owing to mistaken views and ignorance of some of the most common laws connected with mineral veins.

The Problem of Gold and Silver Extraction—A General Review—No. VIII.

BY PROF. L. LANSZWEERT.

Silver exists in veins in the native state, or in what is called native silver or virgin silver, as chloride, bromide, sulpbide, arsenide, antimouide, sulpho-antimonide, and in a great variety of combinations with other metals and substances, forming no less than twenty-three distinct species, already recognized and described by mineralogists and chemists. These mineral species are disseminated sometimes in gangue or vein-stone of an exclusive earthy matter, but generally in quartz; sometimes in metallic sulphides, as blende, galena, copper, or iron pyrites, etc.; sometimes in nickel or cobalt ores, in gray copper ore or bournonites. In nearly all the mines the ores, to a certain depth, have been affected by the influence of surface water, and present thus a more or less complete alteration. In the upper portions of the mineral veins, they are generally more earthy and contain native silver, chloride, bromide, iodide, irregularly distributed in vein-stone of quartz and oxyd of iron. The mineral species containing sulphur, arsenic, antimony, etc., are generally found at greater depth. In 1858, Mr. Bowring described simple and compound "oxyds of silver" as existing in ores of Real del Monte, in Sonora, Mexico, where they are very abundant. And if statistics are true, between 1849 and 1858 the mine of Rosario, in Pachuca, produced nearly 100,000 tons of ore containing a trifle over 1,000,000 marks of silver, about half of which was from the compound oxyd. During the same year, the extraction from the mines of Santa Inez, in Real del Monte, amounted to 40,000 tons, which yielded 531,715 marks of silver, nine-tenths of which were from the same oxyd.

To separate the simple from the compound oxyd, a weak solution of salt is first added to the sample to be analyzed, and the chloride of silver that is instantaneously formed by the simple oxyd is washed out either by ammonia, hypo-sulphite of soda, or a boiling solution of salt. The residuum is digested in a solution of cyanide of potassium and filtered; on adding a slight excess of hydro-chloric acid, chloride of silver is precipitated, tinged purple or rose-colored by manganese. A double oxyd of silver and antimony exists likewise in several of the mines in Mexico and Sinaloa. Combinations with other metals may probably still be discovered. The silver ores, according to their color, are denominated in Mexico as *Colorados*, especially if red; and in Peru as *pacos* and as *negros*.

Native or "Virgin Silver" constitutes the crystalized varieties, with various modifications, "filiform," in threads or filaments, "lamelliform," "grameliform" and massive. It is seldom found pure in nature, but is alloyed with various metals, copper, gold, iron, arseuic, etc. Generally these alloys do not alter much the character of the silver; still they could be designated as auriferous native silver, cupriferous, ferriferous, arseniferous native silver. Native silver is distinguished from arsenical cobalt from the fact that the latter is brittle, and silver ductile. Exposed to the heat of a candle it evolves a strong garlic smell, which is not produced by silver. Native silver is still distinguished from antimonial silver or native antimony, from the fact that the latter have a lamellous texture and are brittle, and that silver is ductile and does not show any indications of lamination.

Sulphuret of Silver, Silver Glance, commonly denominated vitreous, is found in all the principal silver regions, and crystallizes in cubes, lamelliform, aborescent, ramulous; also found in masses without any distinct crystallization. This is one of the most abundant silver ores. It has a metallic lustre, and a blackish, lead-gray color, and streak or powder, which is also shining. It is malleable and sectile—that is, may be cut with a knife like lead; a small piece exposed to the flame of a common candle melts instantaneously, and leaves a button of ductile silver. Sulphuret of silver, exposed to a moderate heat, sometimes evolves threads or filaments of silver, the same as if they were natural. Sulphuret of silver is recognized from native lead, as the latter is nearly a third heavier, and when melted has not that white silvery appearance.

Brittle Sulphuret of Silver, Black Silver Ore, Brittle Silver Ore, form another variety of silver very abundant in nature. Unlike the preceding, it crystallizes in highly modified rhombic prisms, with six sides; but is also found in masses and in disseminated particles. Its color is nearly black, or iron-gray, and the lustre is metallic. It is brittle and yields a black powder.

Chloride of Silver, Horn Silver, is a mineral of yellowish, white brownish, or greenish color, looking like wax, and like it, may be impressed or rubbed smooth by the nail, or cut with a knife. On exposure to the air and light, the lighter colored varieties assume a violet shade, others become brown. It is usually massive or in crusts; but occurs in crystals of the cubic system. Before the blow-pipe on charcoal it fuses readily; emits acrid fumes and gives a globule of silver. It is not soluble in nitric acid. On being moistened with water and afterwards rubbed with a piece of iron or zinc, the surface becomes covered with a film of pure silver.

Antimonial Sulphuret of Silver is divided according to its color into two species. The gray silver ore, frieslebenite and red silver ore, which is divided into the dark-red silver ore—pyrargyrite; and the light-red silver ore—proustite. The gray silver ore contains about twenty-seven per cent. of antimony. The color is light steel-gray, inclining to silver-white, and is also blackish lead-gray. When found crystalized it is generally in prisms, streaked lengthwise, and capable of being cleaved or split. It yields easily to the knife and is rather brittle. When broken, the surfaces are uneven and curved. When fused on charcoal, before the blow-pipe, copious white vapors are given off, with a slight sulphurous odor. Oxyd of antimony is deposited in a white film on the coal, together with a yellow coating from lead. A globule of silver is finally obtained.

The Dark-Red Silver Ore is remarkable for its beautiful red color, which is best seen when a fragment is held between the eye and the light. This characteristic has earned for it the title of "ruby silver," by which it is very generally known. The color, however, is so deep that stout crystals or opaque masses appear nearly black by reflected light; hence the species is also known as "black silver." When powdered it is cochineal red, and this may be shown by scratching it several times, or rubbing it on a file. It is often found in very perfect crystals, which belong to the rhombohedral system. It fuses before the blow-pipe, giving off white fumes of antimony, and finally a globule of silver remains on the coal. The percentage of antimony is nearly as great as in the gray silver ore, but it can readily be distinguished from that species by its form, color and the absence of lead, which would impart a yellow color to the coal around the assay. It dissolves in hot nitric acid, leaving sulpbur and oxyd of antimony.

Light-Red Silver Ore is a species similar to the preceding, but is much lighter in color, and contains about fifteen per cent. of arsenic, and but little, if any, antimony. Before the blow-pipe it acts like the dark-red silver ore, except that the fumes of arsenic are given off, instead of oxyd of antimony.

Letter from Grass Valley.

Messrs. Editors:—In my last communication I endeavored to show, by what I believe to be facts, that this particular locality has not been indebted to foreign capital for its present advancement in mining. The Grass Valley *National* says that it is ready to prove to Grass Valley that we are indebted to foreign capital for our present prosperity in mining. We have anxiously looked for the promised proof, but have seen none. We do not deny that our quartz men may have had thirty or ninety days credit for machinery and mining tools furnished from San Francisco; yet at the same time, by a trifling sacrifice, they could have had the same without it. Our connection and intimate acquaintance with nearly all the leading mines in this locality enables us to know that whatever credit we may have had from the outside, we were in a position to pay at any moment. Our object in writing is, to show that Nevada county offers very great inducements to those who are seeking investments in mines; and to show this, we must refer to what has been done by the limited amount of capital at our disposal in bringing the mines of this locality into their present position.

The Allison Ranch mine is too well known to need anything from me to confirm its reputation, as being one of our mines that never needed the help of capitalists. A visit to it, a few days since, convinced me that it still retains its old reputation. Everything in and about the mine reflects credit to the management; we predict that, with proper application of a few thousand dollars, the south extension will prove as rich ore ground as the original. We understand that the parties owning this ground are men of means; the object perhaps is to have the Ranch Company open out that way, so as to be better satisfied as to the proper point to commence operations, and to erect machinery, which they will have to do. The Forest Springs Mining Company, we are credibly informed, is again yielding good profits. The mines of this company have been very productive, and given handsome fortunes to some of the owners.

The French lead, or what is now known as the North Star mine, is a fair representation of the energy and practical mining ability which have developed our mines. Here was a mine which had yielded immense profits for some considerable time; in fact, so long as the quartz would yield good returns, independent of good management; but the time came when practical mining experience was necessary to work the mine at a profit. This very essential requirement failed to show itself in the concern; consequently the mine had to be taken for debt. We well remember the time when the owners of the mine sold it, on conditions, to a party of good miners, reserving the right to put their own superintendents to manage the work until the miners had paid for it. The result was that the miners could not make their board under such management; so they gave up the enterprise for a while, satisfied that the mine was a good one under proper management. Some of the old party broached the subject to a few friends, who had a few hundred dollars on hand. They formed a company of twenty, all practical men, whose hands had been calloused by the frequent handling of the hammer and drill, and raised sufficient money to pay the first installment. Having the full control of the mine, they went to work, and for the first two years the ore yielded from eighteen to twenty dollars per ton. Out of this return they declared handsome dividends; and at the same time sunk their shafts, extended their drifts, bought out parties owning ground adjoining their mine, erected machinery, and put the mine in such a shape as to warrant heavy dividends for years to come. We believe $15,000 was the amount paid for this mine. To-day its selling value is $200,000. We think we are safe in saying that this has been the best and most economically managed mine in this vicinity, and a credit to every one of its members who have put the concern through. What a pity it is that we have not more of this kind of management in our mines on this coast, instead of those kid-gloved and two-year-old practical miners. We have not suffered much in this locality from such management, but we would call the attention of some of our new-comers, who have invested here of late, to look about them, and make their selections understandingly, as to who they will have to direct the capital they are investing. Much depends upon the management of the mine.

The Scadden mine has been in successful operation some eight years, and under the management of Mr. H. Scadden, one of the most enterprising and practical miners we have, they have realized quite a fortune out of the proceeds of this mine. We think we are safe in saying that this mine has given a profit of $150,000. Our information is such that we can assert that this company had not the use of a single dollar of foreign capital to develop their mine. Some four or five years ago very few supposed that our quartz lodes would be productive below two or three hundred feet on the dip of the lode. The above company leased their mine to a party who was to open it out at a greater depth than they had yet attained. Where this party sunk their shaft the lode had been split into two parts, and did not prove as remunerative as the levels above. They soon abandoned the contract, and the owners of the mine resumed work where the last party left off, and sunk the shaft until the two veins came together. The result is that they have a splendid prospect of having as productive a mine below this level as they have had above. The company will erect pumping and hoisting engines upon this part of their mine this Spring. The Con. Riley mine, adjoining Scadden's, is in full blast, and taking out some very fine ore, which is paying handsomely. Mr. Riley's mine is not large, but it is like the Welchman's cow, little and good. Above Scadden's mine, to the west, on the same lode, is Pratt's mine. Mr. Pratt is one of our pioneer quartz men, and a practical miner. He is preparing a new shaft to open out his mine. I think some 200 or 300 tons of ore have been taken from this mine, which has yielded handsomely. We hear that Mr. Pratt has opened out into the lode this week, taking out some very handsome specimens. We congratulate him upon his success, and expect to see him in a year from this date, driving his team of fast stock. The Stockbridge Company, since I wrote you last, have erected a new engine upon their shaft, and are in hopes of striking the lode in five or six months. The Merrimac mine is looking well; the yield of the ore is not so great as most of the mines about here, but they have a very large lode, that makes up for it. The mine is in fine order for working, under the charge of Mr. Henry Scadden.

I must close my letter, as I do not feel like sitting here alone, while my fellow-townsmen are having such a good time over the fall of the Confederacy. You know our town has had the name of being a Copperhead town. You would not think thus of it to-day. Those little holes where they once mixed Copperhead cocktails, now hang out the stars and stripes, and claim to be good Union men. *Viva l'America!*

– Grass Valley.

Grass Valley, April 10, 1865.

[Written for the Mining and Scientific Press.]

A New Theory of the Origin of Petroleum.

Messrs. Editors:—An editorial in your last issue takes up the question of the existence of petroleum in flowing quantities in certain portions of California, and argues the improbability of finding oil where the strata of rock have been tilted by upheaval from a horizontal position to an angle of thirty degrees, or even less. My object in this article is not to attempt to disprove the theory advanced by you, but to bring forward another, which, if correct, will entirely obviate the necessity of accepting your argument as conclusive, or even plausible.

If we admit the premises upon which your theory is based—namely, that petroleum, while yet in the depths of the earth, is a liquid, and must therefore have its level in the lowest places like any other liquid—then the necessity for basins or cavities to contain it becomes apparent. But this postulate may well be a matter of dispute, since some curious facts connected with the history and characteristics of this remarkable natural production contribute to establish a new and entirely different ground of argument.

It seems to be pretty well authenticated, that in many places in Pennsylvania, New York, Ohio, West Virginia, Indiana, and in California, also wherever petroleum has been discovered, there are innumerable springs or jets of inflammable gas, issuing from as many orifices or fissures in the earth and rocks, in such quantities that the people are enabled to conduct it in pipes to their houses, and to burn it like ordinary gas. This seems to have been the case for years on the Seneca reservation in New York, before the vast resources of Pennsylvania and the other States in this product were even thought of. And the same experiment has more recently been tried with the streams of gas issuing from the oil springs of Pennsylvania and West Virginia. In addition to these facts, we have the statement from the best authority, that when an oil well in the above named districts commences to flow, it also begins to "blow," after the manner of the escape pipe of a boiler under a heavy pressure of steam; which shows conclusively that there must be a great quantity of gas pressing upward for an outlet at the surface.

Now, without any reference to the laws of chemical affinity, the above facts alone would be sufficient ground whereon to erect a satisfactory theory of the origin of petroleum. It does not follow, because the oil appears at the surface in a liquid form, that this is its normal state in the depths, which we know must be reached by boring before it comes forth. And I think it can be demonstrated, without much difficulty, that it exists at those depths only in a gaseous form, and that it is gradually condensed and concentrated as it approaches the surface, where it is again resolved into gas, and leaves behind the baser elements which have combined with it in its ascent.

Considering as true the belief of the scientific geologist, that the metals have all ascended to their position in the primitive rocks in the form of sulphurets, it does not require a very great stretch of theorizing to satisfy us that the same law applies equally well to this mineral deposit in the tertiary formations. For we find not only that the most inflammable portion of petroleum is sulphuretted hydrogen, but also that the base of the same is carbon, and that on being distilled, the resultant is a hydro-carbon of such chemical proportions as to take the form of oil.

Now, the same process of distillation goes on in the earth as we adopt to produce the same result. We have but to consider the earth as a huge retort, at the bottom of the interior of which there is an inexhaustible supply of the materials necessary to this operation. There lies the carboniferous limestone, covered by the saline deposits of the ancient ocean; and this limestone, being decomposed by the action of these deposits and the internal heat, evolves carbonic acid gas, which meets in its ascent to the surface with sulphuretted hydrogen, and combines with it, until, on reaching a point where moisture can affect it, condensation commences, and it becomes oil. The condensation may take place at various depths in different localities, but the process and its result must be the same in all. In this manner we can account also for the large quantities of water which both precede and accompany the issue of oil from the wells. Hydrogen is the main constituent of water; and we may easily see how this gas, on combining with oxygen as it nears the surface, produces water in such abundance as to be a serious inconvenience. Hydraulic pressure alone could never cause the "blowing" described as a concomitant of the "flowing" wells. We are therefore compelled to the conclusion that gaseous pressure is the source of this peculiarity.

Another remarkable evidence of the truth of the above theory is found in the frequent explosions of the "fire-damp," as it is commonly called, in old and deep wells and shafts, owing to the accumulation of carburetted hydrogen in the shaft, while no sufficient outlet exists for it at the surface. This shows also that whatever portions of the hydrogen do not combine with oxygen to form the water that we find exuding into the well, combine with carbon and sulphur, and reach the surface either in the form of gas or oil.

There can be no doubt that the same processes of condensation and distillation which all may observe as constantly going on above the surface of the earth, are as continually operating in the depths beneath its surface. We find that plants and trees are always distilling and exuding their concentrated oily combinations, and also their gaseous emanations, and the counterparts of these processes are found in the distillations and condensations in the earth below. Changes in temperature produce results in upper air, in a great degree similar to these.

Why, then, may we not adopt a theory which vanquishes all apparent difficulties in the way of a satisfactory solution of this important question? If, as has been said, the earth is pervaded and permeated by these subtile gases, from the decomposition of rocky strata far below its surface, which seek an outlet through the upper and colder layers, where they meet with the moisture of its waters, and the oxygen of the atmosphere, and are thereby condensed and concentrated, it must be evident that no basins or cavities except those afforded by the ingenuity of man are needed.

For, according to this theory, however deeply the borer may penetrate the earth with his auger, or follow after with his pipe, the process of distillation and condensation must take place within the pipe itself, and much nearer the surface than is generally supposed. The most positive proof of this is the fact that the borer invariably strikes water first. Is it natural for water to float upon oil? Is it not much more philosophical and consistent to believe that the sulphuretted and carburetted hydrogen become oil by passing through the natural condensers, water and oxygen?

I have thrown out the above suggestions in order that they may elicit further investigation and remark, and trust that some of your readers will take up the inquiry and elucidate the subject, even if you do not.

W. H. Manning.

Remarks.—We place the above communication before our readers, without any further comment than to merely remark that we do not see how the "theory" of our correspondent "obviates the necessity of accepting your [our] argument as conclusive or even plausible" that there is very little probability of finding oil in rocks which "have been tilted by upheaval from an horizontal position to an angle of thirty degrees." Whether the oil has been deposited by the slow and almost inappreciable action of ages; or whether its formation is now in active process and capable of keeping up an intermittent flow, by the formation of a new supply as rapidly as that previously existing has been exhausted by the artificial action of wells, any geological condition which presents a ready access for the oil to the surface, and a consequent exhaustion of the supply, must be more or less unfavorable to the prospect of finding largely productive wells, while the opposite will be true of any region where the rocks are found in a horizontal position always interstratified, as they are, by impermeable beds of clay. We would by no means presume to say that productive oil wells can be found only beneath a horizontal strata; but we do say that a disturbed condition, while it presents more favorable opportunities for surface indications, to the same extent lessens the chances for productive wells.

The Fenians.—According to the New York *Sun*, over a hundred thousand armed men were represented at the Congress in Cincinnati, and this number does not include thousands who are connected with the organization in Ireland, which is of course different from that existing in this country. It is not proposed to organize any armed expeditions from this country, that would involve us in a quarrel with other parties. It is merely designed to form a much-needed nucleus, or moral bulwark, for the encouragement of Irish patriots. The fighting is to be done by Irishmen, upon Irish soil. The inspiration, and perhaps money, will flow from this country. That is all. It is enough, and it is something of which England should be the last nation in the world to complain. Mazzini for thirty years plotted Italian revolutions in London, and the Kingdom of Italy is the result. The present Emperor of France made England the headquarters of his attempt to secure the crown of France. These example could be multiplied. The Fenian organization in the United States and Canada wields an influence to which that of Mazzini and the once insignificant Bonaparte adventurer seem as nothing. All the Fenians ask from the United States Government is the concession of belligerent rights as soon as the first blow is struck. This is just, and should not be denied them. The nationalists can then easily organize a small navy of blockade runners that can inflict serious damage on English commerce and greatly promote the success of the revolution.

Stockings.—The stockings worn by the ancients consisted of strips of linen, or of the skins of animals. The Normans wore them made of cloth, or of costly stuff, embroidered and decorated with gold and silver. Knit worsted stockings were imported first in the time of Henry VIII, and were worn by the gentry of that period; and in 1530 a pair of silk stockings was sent to that monarch from Spain. In the time of Queen Elizabeth it was common for young men of rank to wear stockings of different fashions and different colors on each leg. In 1561 the first pair of silk stockings were knit in England, and were presented to the Queen. About the same period the method of knitting worsted stockings was brought to that country. In 1589 a machine for weaving stockings was introduced by Wm. Lee, and this laid the foundation of the extensive stocking manufacture now carried on in England.

They cast a cannon in Portland, Oregon, on the morning of the 13th, and fired a salute with it in the afternoon of the same day.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, April 29, 1865.

A less active demand for money may be noted this week, and in some quarters available capital is accumulating. Bank rates continue to rule at 1½ ₱ cent. per month, and upon the street there is no change. The increased animation of the share market occasions an additional requirement in stock circles, but no difficulty is met with in obtaining the usual facilities.

Receipts of treasure from the interior since Saturday last amounted to some $1,000,000, and for the current month have exceeded $4,200,000.

Bullion is in fair request, and gold bars have been sold at about 830. Silver is ruling at ½ ₱ cent. premium to 2 ₱ cent. discount.

Legal Tender Notes have been less active than usual, and the aggregate sales amounted to $231,000, opening at 70¾, advancing to 71¼, declining to 69½, and closing at 70¾ bid, 71 asked. Latest telegraphic advices from New York quote gold at 147½.

The stock market has been exceedingly active, but nearly every share on the list has fluctuated materially, and is now lower than at the beginning of the week. The advance in most stocks has been so very considerable within the past month or two, that many parties are anxious to realize, hoping to enter the market again at lower prices. Transfers of capital from the East for investment in a number of prominent claims are going on all the time, and a further decline in gold will facilitate these operations. Promising developments upon certain portions of the Comstock lode have been made lately, and the aggregate product of the Washoe mines is steadily increasing.

Spring Valley Water Company was sold at 51½ per share; State Telegraph at 33, and Pacific Insurance Company at 135. Other city shares are dull, but well maintained.

Yellow Jacket advanced from $2,430 to $2,450, declined to $2,260, rallied to $2,325, and closed at $2,275; in all, 19 feet were sold. The company have purchased the Morgan mill, on the Carson, together with certain materials belonging thereto, for the sum of one hundred and fifty thousand dollars; twenty thousand of which is to be paid next week, and the remainder in twelve and fifteen months. The reduction capacity of this mill will be 80 tons per day, and the property is deemed very desirable at the price named. The product of the Yellow Jacket mine for the current month amounted to 9,000 tons of ore, averaging about $40 per ton, and a dividend of $100 per share will be declared. In drifting south a material improvement has taken place this week, and arrangements are progressing to sink a large new shaft east of the lode.

Gould & Curry advanced from $1,975, steadily declined to $1,925, and was sold yesterday at $1,925, within which range 16 feet were sold. We can learn of no change in the mine, and the regular dividend of $75 per foot will be distributed to the stockholders out of the earnings of this month.

Savage is also in less favor, declining from $2,060 to $1,900, and closing at $1,915 asked; 40 feet changing hands. The character of the second-class ore is said to be improving, and a larger quantity of first-class ore has been found recently. A dividend of $75 per foot will be paid for the month of April.

Belcher has been very actively dealt in, and 70 feet were sold, advancing from $1,670 to $1,718, receding to $1,650, rallying to $1,675, and closing at $1,550, s 30. After the payment of a dividend of $75 per foot for the month of April, a surplus will remain in the treasury of the company.

Crown Point rose to $1,400, buyer 30, dropped to $1,200, and closed yesterday at $1,185 bid; 41 feet have been sold: During the coming month a larger quantity of ore will be taken from this mine.

Alpha (G. H.) has attracted considerable attention, at variable rates, opening at $950 per foot, suddenly advancing to $1,425, then receding to $1,100, rallying to $1,325, again dropping to $1,275, and closing at about $910. At this rauge 82 feet were sold. In the 315 feet level the face of the drift, 18 feet across the lode shows good ore, and in the 550 feet level a drift discloses the same quality of ore, 8 feet in width.

Chollar declined from $845 to $770, and was sold at the close at $780, some 165 feet changing hands. The yield of the mine this week has exceed 1,000 tons of ore, most of which has averaged about $50 per ton. The north and south mines are said to show some improvement. Potosi is also lower, decliniug from $890 to $760, and closing at $775; in all, 90 feet were sold. The product of this claim for a week past has amounted to some 200 tons per day.

Ophir has been dealt in to the extent of 66 feet, advancing from $540, seller 60, to $580, receding to $520, and selling yesterday at $535.

Hale & Norcross rose from $600 to $630, then fell to $580, and is now held at $550. Work upon the incline has been resumed.

Empire Mill & Mining Company was sold at $475 per share, and is now held at $490. The main shaft in this mine is now down 505 feet, and is to be sunk still deeper. Good ore is at present being taken from the second and third levels, and also from the south mine, in all, some 50 tons per day. The company have a sufficient surplus in their treasury for the payment of a dividend.

Minerva has been active at fluctuating rates, advancing from $275 to $525 per foot, dropping to $280, rallying to $400, receding to $360, and closing at about $350; within this range 198 feet were sold. The shaft is now down 410 feet, and at a depth of 475 feet a drift will be started to explore the lode at this point.

Uncle Sam rose from $295 to $320, buyer 30, fell to $298, and was sold yesterday at $298. Overman is steady at about $300. The new stock of the Overman Gold & Silver Mining Company is now being issued to the shareholders of these two companies.

Imperial has been in decided favor, advancing from $230 to $300, dropping to $285, and closing at $295 asked; 288 shares were sold. In the Holmes ground, a drift from the Challenge shaft, 440 feet from the surface, has penetrated a vein of very rich ore, some 6 feet wide, and the east drift from the Alta shaft, has developed a body of valuable ore, at least 30 feet in width. At the bottom of this shaft good ore is also found. A dividend of $10 per share will probably be declared for the month of April.

Bullion has been very largely dealt in, and 516 shares changed hands, advancing from $172 to $195, buyer 30, receding to $175, and closing at $180. No important developments have been made recently.

Confidence (G. H.) has been sold at $175 per share. This claim comprises 130 feet, and monthly dividends of $100 per foot have been paid for some time past. The present product of the mine averages some 50 tons of ore per day, worth about $45 per ton, and preparations are being made to open a new level at a greater depth.

Burning Moscow has been steadily maintained at $55@60, closing at $49. Nevada (J. G.) rose from $55 to $70, declined to $55, and sold yesterday at $67½. Within this range 325 shares were dealt in.

Sierra Nevada was sold at from $23 to $25, closing at $23. North American sold at $29@32, and closed at $31. Real del Monte advanced to $17@18, and Caledonia Tunnel is inquired for at $14.

The aggregate sales of stocks and Legal Tender Notes since Saturday last amounted to $1,153,663.

Mechanical.

Improvement in the Mowing Machine.—Mrs. Elizabeth Smith, of Burlington, N. J., has invented what purports to be an important improvement in the mowing machine. We have not seen the improvement described, but persons desirous of learning any facts in regard to the same are referred to Dilwyn Smith, of Burlington, N. J.

Extra Hard Steel.—Mr. R. Mushet writes to the *Mechanics' Magazine* that he can produce steel so hard that it will bore the hardest rocks, and when boring ordinary rocks will be almost imperishable in its edge. In limestone a nine-feet shaft costs £7 per fathom; and in hard capel or roskear stone it costs £60 per fathom; with the improved steel he thinks the cost in the hardest stone will not be more than it now is in the softest.

A Newly Invented Button has been introduced to the public, in New Haven, Conn., which it is claimed must quite supersede the ordinary button. By it one person can attach more buttons to a garment than ten can by the needle in the same space of time! and when on, a button cannot be pulled off in or diuary wear. They are making the buttons in Westport, Fairfield county.

New Style of Railroad Cars.—The discovery of petrolenm has caused many new inventions in regard to wells, pumps, casks, burners, modes of rectifying, etc., connected with it, over thirty patents having been issued during the last six months of 1864. The latest novelty is the cars now used on the Pennsylvania railroads to transport it. The cars consist of pairs of wheels about sixty inches in diameter, each pair joined by a hollow iron axle of about fifty inches in diameter, above which are placed ordiuary wooden freight beds. These axles, having valve doors, are filled with petroleum from a spout at the works, other freight is put on the ordinary place, and the train started for Philadelphia, where upon opening the axle valves each axle discharges about five hundred gallons into tanks prepared for the purpose, and the other freight is disposed of in the ordinary manner.

Rule for Measuring Cylindrical Cisterns.—Take the length, width, and depth in feet; multiply these together, and the product by 1,865; cut off four figures on the right, and the result will be the contents in barrels. Example—Find the contents of a cistern six feet in diameter and nine feet deep. Six feet, the length, multiplied by six feet the breadth, and the product by nine, the depth, gives 324, which multiplied by 1,865, and four figures cut off, gives sixty barrels and a decimal. In this case we consider the diameter as being both length and breadth. The reason of the rule is this, a cylinder one foot in diameter and one foot long, would measure 1,865 ten thousandths of a barrel. A cylinder nine times as long would contain nine times as much, and six times as wide, six times as much as that. The number 1,865 is easy to remember, as it corresponds with the new year.—*Scientific American.*

The Art of Enameling.—Enamels are compositions of various substances, which when vitrified upon the surface of opaque bodies, communicate their colors and produce the effect of painting. The basis of all enamels is highly transparent and fusible glass, which readily receives a color on the addition of metallic oxyds; a red color resulting from the oxyd of gold, green from that of copper, violet from that of manganese, blue from cobalt, and a fino black from iron. Enamels are applied in a thin stratum to brightly polished metallic surfaces, such as copper and gold, upon which they are fused by the flame of a lamp (urged by a blow-pipe), or by the heat of a small furnace; when cold they form a kind of vitreous varnish. The art of enameling acquired the greatest perfection in ancient times; the Egyptians practiced the art, which was also known to the Saxons. Very beautiful specimens are still preserved, which modern artisans are unable to equal, and with the materials of which they are totally unacquainted. At Oxford (England), there is an enameled jewel that was made for King Alfred, A. D. 887, as shown by an inscription. At the present day this pleasing and useful application of human industry is carried on with the greatest success by the Venetians and French; the former being the most expert.

Fifteen tons of coal per day are being taken from a coal-bed in Rhode Island. In Massachusetts (near the Rhode Island boundary line) some coal-beds were tried thirty years ago, but not found remunerative; but the present high prices may, perhaps, make them remunerative.

Sherman's army may not be as large as Napoleon's Grand Army, but it has done quite as graud things.

The Pantelegraph.

We have several times had occasion to mention the Abbe Casalli's wonderful invention, by which he not only transmits from one place to another the words of a despatch, but the very handwriting of the person who sends it. As this new telegraphic system is now beginning to receive a practical application on a large scale a description of the apparatus may not be uninteresting to our readers:

Imagine a cast-iron frame shaped like an A and a pendulum suspended from its apex. At each foot of the frame there is an electro-magnet, through the action of which the pendulum, which is two metres in length, oscillates between them, according as an electric current passes from one to the other. About the middle of the shaft of the pendulum there is a sort of arm or cam, which at each oscillation causes a lever fixed to the cross-bar of the A to describe a circular arc. At the end of each oscillation this lever twice meets a click and spring work fixed to the same cross-bar. At the first stroke the metallic vibration is interrupted, and at the second a fork is set in motion, the prongs of which alternately act on the teeth of the ratch, which is thus forced to turn, and in so doing communicates motion to an endless screw cut into its own shaft. The endless screw causes two small chariots to move simultaneously, and each chariot carries a fine steel point or stylus. Now as, in virtue of the endless screw, these two points move uniformly in the same direction—the progress of the one not differing from that of the other even by a hair's breath—it follows that whatever stroke will be described by the one will be imitated with mathematical exactness by the other. Now, suppose a metallic plate to be placed under each point, these plates being curved like the circular arcs described by the points, then, after a certain number of oscillations of the pendulum, these points in moving along will have described upon the plates as many parallel lines infinitely close to each other as there have been oscillations. Hence the whole surface of the plates has been gone over. The plates are in direct communication with the ground by means of chains. One of the plates we will call the transmitter the other the recipient. The sender of a despatch writes it with common ink on a sheet of tinted paper, and places it on the transmitter. On the recipient we place a sheet of chemical paper, impregnated with a solution of cyanide of potassium. Let us now set the apparatus in motion. The current being established, so long as the point of the transmitter only touches upon the tin, the electric fluid will escape into the earth; but no sooner does it meet the ink of the writing, which is a non-conductor, than the fluid, not finding an escape there, will seek it along the wire which connects two points together. Thus the point which works on the chemical paper of the recipient will produce a blue stroke on the latter for every black stroke of the despatch; for steel in contact with cyanide of potassium, and under the influence of a positive current, produces blue. Hence, supposing the despatch to have been written in black in Paris and transmitted to Lyons, the correspondent of the latter place will receive in blue the act *fac simile* of the sender's hand-writing. An order to pay a certain sum may be transmitted with perfect safety.

A New Style of Church Architecture.—A church building has recently been constructed in Edinburgh, Scotland, which presents quite an innovation on the ordinary style of ecclesiastical architecture. The building is of stone, 116 feet long; one end is 100 feet wide and the other but forty. This, it will be perceived makes the building *fan*-shaped. In its interior arrangement all the aisles radiate from the pulpit like spokes from the hub of a wheel. The pulpit, or rather reading desk, forms the eye of the fan. The seats are arranged in three tiers, or benches. At the back of the first, and some nine feet above it, rises the second tier, which is arranged in a sloping direction; while the third tier, which rises immediately from the end of the second, and also nine feet above it, slopes still more acutely till it reaches the back of the church. Beneath the second stage of pews a wide passage runs, from which access is obtained to the central division of the lower range of pews, and beneath the upper stage is a large school-room. By an arrangement of sliding screens, the passage and school-room may be open to the church, and thus afford accommodation for nearly a thousand additional hearers. Thus, on any special occasion, the church can be adapted to accommodate about 2,300 people. The ordinary accommodation of the church is for about 1,200.

There is a pony in Cork which a paper there claims to be the smallest in the world. It came from Iceland, is four years old, stands two feet two inches high, and weighs only about eight stone.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the Mining and Scientific Press—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can ship their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be void, and the invention therein described shall become public property as against the applicant therefor; *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associates in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we forward a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of preparing drawings, models, specifications, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects or governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the invenlor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including spirits, statues, busts, statuary, bas-reliefs, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be receiveil in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the Mining and Scientific Press would call the especial attention of Mining Secretaries, Trustees and Shareholders, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The Press enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the Press is less by one half than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the Press, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the Press or some other paper.

6th. Many copies of the Press are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the Press, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

Last, but not Least.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the Press shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

Mining and Scientific Press.

W. B. EWER.....SENIOR EDITOR.

Terms of Subscription:

One copy, per annum, in advance.....$5 00
One copy, six months, in advance.....3 00

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventions can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we would furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions or machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, April 29, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

THE PRESCOTT CONSOLIDATED MINING COMPANY is the corporate name of one of the leading mining organizations of Arizona, having its headquarters in New York. The capital stock of the company is placed at $10,000,000, in shares of $100 each. The company holds thirty-one different locations, of gold, silver, copper and lead. These locations have been made by experienced parties, long residents of Arizona, and are chiefly in the immediate vicinity of Prescott, the present Capital of the Territory, which is situated about 150 miles from the navigable waters of the Colorado, to which it is accessible by good roads of easy grade. The country about Prescott is also free from all danger from Indian troubles, there being ample protection at hand from United States forces. The character of the principal officers connected with the management of the company, is also a safeguard against any possible speculative impositions upon outside stockholders. Among the officers we notice Mr. Goodwin, Governor of the Territory, Chas. D. Porter, Territorial Delegate at Washington, Governor Curtin, of Pennsylvania, and others. Wm. T. Coleman & Co., one of the leading mercantile houses of this city, act as Treasurer of the company. One-half the capital stock of the company is devoted to securing and paying for mineral property. The balance is to be sold to procure working capital, machinery, etc. A limited number of shares have been put in the market, at ten dollars per share, to secure the necessary funds to start the work. The local superintendence of the company is in the hands of Col. J. C. Lowe, who is now on the ground, arranging the necessary preliminaries for commencing operations.

THE Monte Diablo Oil Company filed its certificate of incorporation, on Monday last, at the office of the Clerk of the County Court. The object of the company is to carry on the business of mining on three certain veins, situated and recorded in the county of Contra Costa, known as "The Monte Diablo Oil Company's section." The capital stock of the corporation is $250,000, divided into 50,000 shares of five dollars each. The Trustees for the first three months are Frederick Collier, William Reynolds and W. T. Grissim.

THE 7-30, GOVERNMENT BONDS.

Wells, Fargo & Co. have recently been appointed agents in this State to receive subscriptions to the U. S. Government Seven-Thirty Loan. These bonds bear seven and thirty one-hundredth per cent. interest, payable semi-annually in currency; hence their designation—"Seven-Thirty." They are to run three years from date, which will be either June 1st, 1864, or June 1st, 1865; at the expiration of which time they may be either redeemed by the Government or converted into six per cent. gold bearing bonds, payable in five or twenty years at the option of the subscriber. This species of property is not taxable. The advantages of this loan as an investment may be stated as follows:

Suppose a man invests $10,000 in gold, he saves on that sum, first the amount of the taxes—equal in this city to three per cent. per annum in gold. He purchases $14,000 in bonds, on which he draws interest in currency at the rate of 7 3-10ths per cent. per annum—equal, with taxes saved, to near twelve per cent. per annum—making the interest on the amount of gold originally invested equal to eight per cent. per annum in gold, for a term of twenty years, with a sure paymaster. This is full as good, if not better, interest than persons can obtain year in and year out, clear of losses and expenses, by loaning out money even at the high rates of interest now ruling in this State. As an evidence of how money is to be made in these bonds, which are rapidly increasing in value, and which in three or four years will doubtless be on a par with gold, it may be stated that parties who in June last invested $10,000 in gold in the bonds of the Government, can now realize nearly $19,000 in gold for the same bonds, in addition to over $1,600 interest already received—thus making about ten per cent. per month on the amount of the original investment. Subscriptions can be made at any place in this State where Wells, Fargo & Co. have an office, and the semi-annual payments of interest will be paid to any person who presents the detached coupons to the Assistant Treasurer in this city, or in any other city where there is a branch of the Treasury Department. The bonds can be made payable to order or bearer, or to any designated person here or at the East, and can thus be used for remittance to friends, as a present, or in the way of business.

These bonds are issued in sums as low as $50. As this is the only available means which the Government has of meeting its present extraordinary expenses, except that of resorting to foreign loans, which would be ruinous in the extreme, this loan commends itself in an especial manner to all loyal citizens. It is not only desirable as a financial investment, but should be equally welcomed through patriotic motives. It is to be hoped that the loyal citizens of California will take a heavy interest in this liberal and patriotic fund.

ASSESSING THE MINES.—The County Assessors in the new State of Nevada are making preparations for the assessment of the gross proceeds of the mines of that State. All ore worth over twenty dollars per ton is assessable and liable to pay a tax on its value, deducting twenty-five per cent. for reduction. The officers of the mines will be compelled to make a statement of the proceeds of their respective mines for the quarter commencing with the 1st of January last.

AMERICAN LOCOMOTIVE TIRES.—The Boston *Railway Times* gives some statistics which go to prove that the manufacture of railway tires in America has now been brought to such a degree of perfection, that our home-made tires are actually better than those of foreign make, and capable of doing more service.

INTERIOR TRADE.—A pamphlet lately issued from the Treasury Department appraises the total value of the trade between the East and the West, leaving out way freight, at over $1,100,000,000 per annum.

THE amount of currency now afloat is estimated at about $1,156,000,000.

AN INTERESTING RELIC—THE EARLY DEVELOPMENTS OF STEAM.

Mr. S. Heald, of the Vernon Flour Mills, of Napa, has exhibited to the Napa *Register* an interesting relic, which consists of an old leather-bound volume of early American book printing, entitled, "*The Young Millwright and Millers' Guide*, by Oliver Evans, of Philadelphia." It was "printed and sold by the author," in 1795, and was printed on an old wooden press, and on hand-made paper. It contains numerous illustrations, engraved on copper, rudely done, descriptive of the mechanical and labor-saving devices of those days, the sight of which cannot fail to draw a smile upon the countenance of the modern mechanic. And yet Evans was a great mechanic in his day—one of the most ingenious of his age—a practical worker and an original thinker. We reproduce the following extract from the columns of the *Register*, which paper copies from the book. In speaking of steam, Evans says:

The limits of the prodigious power of repulsion, which takes place between the particles of heated air and steam, are not yet known. Their effects are seen in the explosion of gunpowder, the bursting and cracking of wood in the fire, etc. In short, in every instance, where steam could not find room to expand itself, it has burst the vessel that confined it, endangering the lives of those who were near it. A worthy and ingenius young man, having prepared a vessel of wrought iron, about three inches in diameter, and eight inches long, partly filled with water, and put it into a smith's fire, and was trying some experiments, when the aperture, by which the steam was meant to issue, got stopped by some means (as is supposed) and the vessel burst with a noise like a cannon, carried off his right arm, and left it lying across one of the upper beams of the shop, and otherwise desperately wounded him. This prodigious power is employed to raise water out of coal mines, etc., from great depths, in surprising quantities, and to run mills. It may (in my opinion) be applied to many other useful purposes, which it is not yet applied to.

We learn from a private letter from Mr. Heald, that it is his purpose to present this book to the Library of the Mechanics' Institute of this city. The idea is a good one, and will doubtless be duly appreciated by that body, by whom it will be sacredly kept as a memento of the early dawn of modern mechanism. If the author had lived to the present day what a wonderful confirmation would he have realized of his early opinion of the future power and value of steam! It is said of this book, that although it is full of crude theories and mistaken notions, it nevertheless exhibits a large amount of practical good sense, of value and interest to mechanics even at the present day.

IMPORTANT.—Not the least important of the news which has lately come over the wires from the East, is that, in relation to Mexico. It has been quite evident for some weeks, that Juarez is about to shake off his stupor preparatory to a pounce upon the imperial eagles of France and Austria in their connubial slumbers. By the telegraph of Wednesday last it appears that the Mexican Minister had a lengthy and important private interview with the President on Tuesday. General Ortega has been sent for, from St. Louis, and at the date of the despatch was hourly expected—a circumstance imparting additional significance to the audience of Tuesday.

CHOPPING WAGER.—Hiram Painter, of Waterbury, Connecticut, recently won a wager of $50, by cutting a log ten feet long, three and a half feet thick at the butt and three feet at the small end, into kindling wood, in eight hours and fifty-four minutes. The time allowed in the bet was ten hours. He broke two axes in doing it.

A LOUD CROW.—At the last meeting of the Polyteehnic Association, at Paris, in a discussion on the effect of topography on the sound of bells, Mr. Meyer, of Switzerland, stated that he had heard a cock crow at Wasser, across Lake Geneva—a distance of nine miles.

SINKING.—It is said that Mount Baker is rapidly sinking in—having fallen over one thousand feet from its former altitude, though it is still in a state of eruption.

MINING STOCKS IN NEW YORK.

According to the New York *Stockholder*, mining stocks are beginning to be somewhat neglected in New York, especially gold and copper. The principal stocks in that market have been those of Colorado. They are fast disappearing from the quotation list, and it is thought, until regular returns from those mines fully establish their value, Colorado stocks will be unable to regain public favor.

It further appears that this condition of things has been chiefly brought about by a similar proceeding, which has worked so disastrously for California stocks, both at home and abroad—the unscrupulous action of speculators, who have taken advantage of the mining furor which has recently prevailed, to force upon the market worthless schemes. People could not distinguish good companies from bad, and in disgust they decided to give the cold shoulder to nearly everything.

Nova Scotia gold stocks have never been favorites with the public, in spite of dividends pomposly announced by some companies. The disastrous *fiasco* of one of them—the New York and Nova Scotia Gold Mining Company—was not calculated to encourage New York capitalists to invest in those stocks. With regard to Lake Superior companies the *Stockholder* says:

Lake Superior copper companies are perhaps less neglected than Colorado and Nova Scotia organizations—at least, all well managed concerns, like the Quincy, Central, Franklin, etc., which pay dividends and are in possession of public confidence. But little is even doing with stocks of this last description. Distrust, however, generally prevails in regard to Lake Superior companies. Many do not rest on a substantial basis; they have been organized against all the rules of common sense, and have no vitality whatever. The practice of assessments is pronounced a bad one by general consent, and has to be abandoned. As the most part of the Lake Superior companies depended on assessments to procure their working capital, and as the assessments are not forthcoming, and will never make their appearance, the unfortunate concerns have but one course to follow—to stop all work at their mines and close their offices.

IMPROVEMENTS IN PHOTOGRAPHY.—In our notice, last week of the recent improvements in the photographic art, we neglected to mention the following, which is in fact a new art, and is called by its inventor, M. Willeme, *Photo Sculpture*, and is described as follows:

It is a method of preparing with the minute accuracy of photography, busts of living persons in plaster. Some specimens exhibited in London have created quite a sensation. M. Claudet, the London agent, explains the process as follows. The person whose busts or statues is to be taken is placed in the center of a circular apartment, forty feet in diameter, and twenty-four cameræ obscuræ are placed along the wall, at equal distances from him and from each other. By means of a latch, which raises and drops the slides simultaneously, twenty-four photographs of the many sided sitter are taken at once; there being six front, six back and twelve side views. The negative of one of the portraits is then placed in a magic lantern and the image it holds projected upon large sheets of rough glass. The block of clay is then placed on a revolving stand, the circumferences of which are divided into twenty-four parts. A pantograph is employed, by which the clay is cut exactly to represent the outline on the glass. When one photograph has been copied, the image of the next is placed in the lantern, and the clay is turned one twenty-fourth of the circle. The result is that the block of clay exhibits twenty-four photographs. The bust then needs only a little finishing and polishing to be quite perfect.

HANSBROW'S MINING PUMP.—This celebrated mining pump, says the Nevada *Transcript*, can be seen in successful operation at the Federal Lomes ledge, above the Oriental mill, on Deer creek, Nevada; where all wishing to see it work can have an opportunity. The company say it will throw one-third more water with less power than any eight or nine-inch Cornish pump now in use. The capacity given by Hansbrow is 10,575 gallons per hour.

NINTY-FIVE per cent. of the soil of England is under cultivation; in Russia less than one-fifth is cultivated; in Sweden, one seventh; in Austria and Holland, one-fifth; in Switzerland, one-fourth; in France, fifty-four-hundredths.

„Important if True"---A New Process for Disintegrating and Desulphurizing Ores.

Some of the Eastern papers have recently been very much exercised over an alleged discovery for disintegrating and desulphurizing gold, silver and copper ores. The discovery is said to have been made by a chemist at Chicago, who has sold it to a party at Cairo. It is claimed that it must work an entire revolution in quartz mining. A correspondent of the Colorado *Mining Register*, writes to that paper, from Cairo, under date of February 7th, as follows :—

"I had a talk with one of the parties a few days since. He told me the result of their experiments. The hardest rock is made so soft that it can be pulverized by the finger as fine as dust. The action of the agents are said to be neither chemical nor mechanical, but of two opposing forces of nature, that are well understood as simple as could well be imagined; that the necessary material is abundant everywhere and cannot cost more than one dollar per ton of quartz. He told me that it was thoroughly tested in Chicago, before scientific men and practical miners, among whom were two men who represented a company and had recently came from Idaho to purchase a mill, and on witnessing the experiments they immediately abandoned the mill arrangement they had been making, and offered ten thousand dollars for a knowledge of the secret. The parties have now gone to New York to present it there, and one of them told me he intended to go from there to California."

From a subsequent number of the *Register*, it appears that one of the parties connected with the alleged discovery, has visited New York, and exhibited the working of the process to the Board of Brokers of that city, when it created considerable interest. It was tried on some of the Colorado ores, which were in New York at that time, and the ores afterwards returned to Colorado. These ores had been seen and examined by the editor of the *Register*, who does not appear to think the process fully satisfactory, as the ore is neither thoroughly desulphurized or properly crushed. He nevertheless pronounces the ore very much softened, so much so that he thinks it might readily be completed by the ordinary pan process. The party who communicates the facts in New York, says that "fire and water are used in the process, and one other element or ingredient, which is the secret; but the article is easily obtained almost anywhere, at a trifling expense. Estimated cost, one dollar per ton."

We unite with the *Register* in the hope that the discovery or invention may succeed, but we have very little faith in the belief that crushers, stamps and roasting furnaces will be thrown aside for some time to come. We shall place all future developments before our readers as fast as they may transpire; and whenever the discovery is put to a fair, practical test, we shall take the greatest pleasure in placing the fact before our numerous and intelligent readers.

LAST WORDS.—Our late Chief Magistrate uttered not a word after he had received his death wound; no sententious sayings, such as are often attributed to the departing great, escaped his dying lips, but the following sentiment, uttered on the occasion of his inauguration, should live forever. It should be engraven on the monument of the illustrious dead. And if there is a solitary human feeling in the hearts of the assassins or the guilty approvers of their act, the kind and merciful spirit expressed, will cause them to writhe in agony. "With malice toward none," said the martyred statesman, "with charity for all; with firmness in the right, as God gives us to see the right, let us strive on to finish the work we are in; to bind up the nation's wounds; to care for him who shall have borne the battle, and for his widow and orphan—to do all which may achieve and cherish a lasting peace among ourselves, and with all nations." *Sacramento Bee.*

THE Telegraphic Fire Alarm was put in effectual operation on Tuesday and rang two alarms; the first, at about 12 M. for a fire in a newly constructed building on Bush street, and the second shortly after midnight, for a fire in the vicinity of Powell and Market streets. Both were speedily extinguished.

SCULPTORS have to strike almost innumerable blows upon the marble block to develop the statue that is hidden in it. Schoolmasters are apt to think they must treat an urchin's body in the same way to develop his mind.

Singular Facts--Music and Acoustics.

It is well known that the human eye always attempts to supply the complement of color. Thus, if the eye rests for any time on any one color, say green—which is composed of blue and yellow—on shutting the eyes a faint repetition of the object will be seen in red, which is the third of the primary colors and complimentary to the other two. The laws of acoustics are hitherto but little known, but it would seem that a similar effect is produced, notes of the major triand when struck, calling forth a faint impression on the ear of other notes being supplied. It is a curious fact, and one which quite upholds this law, that on striking any chord on the piano-forte, all the strings of the same chord throughout the instrument which are in unison with the notes struck, are in vibration, while the other notes are not agitated. This can be ocularly demonstrated by placing on these strings little saddles of paper, which will be seen to vibrate violently, while when placed on other strings which are foreign to the chord, they rest undisturbed.

As a further and equally remarkable instance of the power of music, in its relation to the human organism, the following circumstance is related on such authority as to find its way into Arvine's *Cyclopedia*: "The morning following the battle of Yorktown, I had the curiosity to attend the dressing of the wounded. Among others whose limbs were so much injured as to require amputation, was a musician, who had received a musket ball in the knee. As is usual in such cases, preparations were made to lash him down to the table to prevent the possibility of his moving. Says the sufferer: 'Now, doctor, what would you be at?' 'My lad, I am going to take off your leg, and it is necessary you should be lashed down.' 'I'll submit to no such thing; you may pluck the heart from my bosom, but you'll not confine me. Is there a fiddle in the camp? If so, bring it to me.' A violin was furnished, and after tuning it, he said: 'Now, doctor, begin.' And he continued to play until the operation, which took about forty minutes, was completed, without missing a note or moving a muscle."

A Furnace Improvement.

Mr. Terry McGinnis, of this city, has perfected and put in operation at the California mill, where it is highly approved and endorsed, an improved Reverberatory Roasting Furnace, for chlorinizing silver ores. The invention of Mr. McGinnis consists in a series of return flues beneath the hearth of the furnace, with some minor improvements in regard to the discharging. Heretofore, as all know, the heat from the furnace passed over the pulp spread on the hearth, and then passed off through the chimney, carrying, with but slight hope of recovery, all volatilized metal, wasting much heat and touching only the surface of the ore operated on. In the roasting of sulphureted ores, soon after the heat is applied, the sulphur takes fire and of itself furnishes a great amount of heat; this, under the old plan, is not utilized, but escapes directly. It is claimed that by the system of return flues, the heat of the burning sulphur is utilized, that the bottom of the hearth being heated simultaneously with the surface, the pulp is made lighter and the wasting more homogenous—none escaping, and that the operation is completed in two-thirds the time and in a more thorough manner, consequently causing a great saving in metal, fuel, time and labor. Mr. McGinnis is an old hand at the business, and understands what he is about; having, we believe, built nearly all the furnaces now in use in Austin. Measures have been taken to procure a patent for this invention, and for this a complete model has been constructed that shows an improved reverberatory furnace in miniature. This can be taken apart to show all the features. The drawings and specifications are by S. B. Smith, Esq., and fully and fairly represent the invention and the claims.—*Reese River Reveille.*

A TRICK OF THE TRADE.—It is well known to the purchasers of dry goods that cotton cloth made within the past two or three years is much inferior in quality to that manufactured before the war, and consequently there is a great demand for "old cotton." One of the tricks of trade is, to take low-priced cotton, wetting it to take out the sizing, and drag it about the store, so as to give it the appearance of age. This "doctored" cotton is then placed in the window, labelled as genuine old cotton, slightly damaged, and for sale at reduced price. No better advertisement than this can be found, and the consequence is that the "slightly damaged" article sells rapidly, while that which remains in the state in which it comes from the manufacturer, though offered at the same price, is untouched. The purchasers go away believing that they have made bargains, and the shrewd shopkeeper sets to work and prepares another lot of cloth for display.—*Boston Traveller.*

LARGE CAPITAL.—The capital stock of the Consolidated Chollar and Potosi Mining Company has been fixed at $5,000,000.

THE JENNINGS ESTATE.—Most of our readers have undoubtedly heard, at some time or other, that a large property in England, estimated at several million pounds sterling, known as the Jennings estate, has been claimed by the American heirs, descendants of the brother and sister of the English Jennings, the former which settled in Virginia and the latter in New Hampshire. The case has been in the English Chancery Court for many years; and the American heirs have spent considerable sums of money in prosecuting their claim to the estate, until at last, as we are informed by one of the heirs, they have obtained a judgment in their favor. The estate will be a very handsome plum to divide; and the heirs will make a respectable figure in the list of income taxes when the income officers make their next annual returns.—*Boston Herald.*

Mining Summary.

WASHOE.

The Gold Hill Draining Company, says the *News*, is fast being put in position, and will in a short time be ready for use. At this time their main shaft, at the Alta mine of the Imperial Company, at which the works are being erected, is down 560 feet, and the work of sinking is being pushed daily with vigor. As yet but little water has been encountered, and in all probability before it becomes troublesome the pumping apparatus will be ready for operation.

New Mining Districts.—According to the *Enterprise*, extraordinary assays and yields by mill process have been obtained from the ores of several of the new mining districts, at Desert, New Truckee and Pine Wood. Several assays have recently been made, showing a yield of from $500 to $2,500 per ton. The citizens feel no hesitation in advancing money to develop these mines. About the 10th of May a five-stamp mill will start in Desert district. This region is the most dreary, arid and perfectly barren in the whole State. One year ago any person proposing to erect and run a mill in the district would have been looked upon as little better than an idiot. Now the mill is almost completed. In Pine Wood there are not only mines of marvellous richness but an abundance of wood and water. Before another year rolls around there will be at least five mills pounding away in Pine Wood district. We are but just beginning to know and appreciate our wealth. The editor of the *Enterprise* professes to know more about these new ledges than he is allowed to publish, and expresses the most confident anticipations that astonishing results will be obtained.

Copper Ore.—Among the minerals known to exist in Nevada, and which will eventually add materially to her wealth, says the Gold Hill *News*, is copper ore. Recent discoveries of immense quantities of this metal have been made on Walker's river, and energetic men are busily engaged in preparations to commence mining the same at an early date. A road intersecting with the main Reese River route is shortly to be built, a town started, machinery erected, and perchance in five years Nevada may be able to boast of as rich deposits of copper as has the famed Copperopolis of California.

The Comstock.—Below Gold Hill the work on many of the mines supposed to be on the Comstock ledge is being vigorously pushed forward, and good reports are expected from them sooner or later.

The Challenge Mine.—Work on the ledge has been stopped, and the work of sinking their shaft for a distance of 200 feet below their present level will at once be commenced. Whenever 100 feet is attained, a level will be opened; and so on as deep as the shaft can be pushed. Some very fine ore has recently been taken from this mine, and undoubtedly the lower level will show ore of increased richness.

ESMERALDA.

A lot of rock has recently been taken to Aurora from the Silver Eagle ledge, Silver Peak district, which the Wide West mill worked, giving a yield of $120 to the ton. The ledge is said to be thirty feet wide and all of the same richness. A load had previously been taken to Austin, crushed dry and roasted before working, with a yield of $363 to the ton. That district (Silver Peak) and Columbus continue to attract increased attention. A rich ledge has been opened at Bodie district by J. W. Bidleman and others. It is calculated that district will take a large share of attention this season. The New York Company, it is said, intend building a large mill in addition to the one purchased by Fogus, and working their mines in that district extensively.

REESE RIVER.

It is reported that a company has been formed in New York, who have subscribed a working capital of $200,000, for mining and working the Olaucho lode. The Olaucho was discovered by Dr. Stearns, about one year ago, and from an incline run on the vein some most excellent rock was taken out. It lies in the neighborhood of Telegraph cañon, and is in a very favorable place for mining. The Olancho gives evidence of being a very valuable lode.

The Mammoth District.—The *Reveille* has seen some very rich rock from the Mammoth district. The specimens from the Sacramento and Rough Diamond show an abundance of black sulphurets of silver. These leads are several feet in width, and contain pure ore throughout. Mammoth district is in Nye county and is without doubt one of the best sections of the Reese River country. The great number of lodes of iron, copper and silver, their great size, and the abundance of wood and water, give this district great advantages. Mr. Clayton, the well known geologist, has expressed an exceedingly high opinion of the mines of Mammoth. When such men speak well of them, after a careful examination, there can be no doubt as to their value, and they will not long remain undeveloped.

The Gorman & Pendegrast Company, on the Rock Curry ledge, have lately been taking out some of the richest ore ever brought to the surface in any silver mining country. Two large specimens, weighing together about eighty pounds, are on exhibition at Austin, Nevada. These are pieces of nearly pure sulphurets of silver glance ore, as described by Kustel, and are estimated to contain about $500 of silver. They were obtained from a depth of between forty and fifty feet, and the bed appears to be extensive. Rock Curry is near the summit of Lander Hill, near and parallel with the Smith & Martin. By some it is supposed to be the extension of the well known Revenue lode.

CALIFORNIA.

Papers from the mining counties still continue to bring in most favorable reports; and new discoveries in quartz and improvements in veins long worked give evidence that our mines are still responding to the sturdy blows of the pick and shovel in a manner most encouraging to all.

Shasta.—The Spring Creek Company commenced operations on Monday last with all the modern improvements for amalgamating and saving the gold added to its machinery. They have a good supply of splendid rock on hand.

The *Courier* says that Erastus Dickinson, of French Gulch, has discovered and located a very rich gold bearing lode of quartz, near that town. It is supposed to be a continuation of the Highland, which has been paying so richly.

Plumas.—The Burge Mill, on Rush creek, cleaned up $1,500 for their last run of ten days. The quartz from their ledge is improving.

The Pea Soup Company's claim on the East Branch is paying about $100 per week to the hand. Butler & Co., at Junction Bar, are making big wages in their claim.

Several companies on the North Fork have commenced putting in wing-dams, and one or two companies have already "turned the river," and have commenced washing pay dirt.

The mines on Grizzly creek are paying well; a large number of claims are being worked. There are at least 100 men now at work in that locality.

We are indebted to the Quincy *Union* for the above items.

Mariposa.—The *Gazette* says that the Frazer quartz vein, situated in Green Valley, has been leased to Dr. H. C. F. Behrens, an old time resident of Quartzburg, but late of San Francisco. The mine has been badly worked, but under the present management is turning out to be a paying institution. Dr. B. is an energetic and enterprising man and deserves success.

Los Angelos.—The Los Angelos *News* claims that Los Angelos county is one of the richest mining counties in the State.

The Clear Creek mining region in Los Angeles county is very rich in gold.

Tehama.—The *Independent* says that Kelly's mill has finished crushing fifty tons of rock from the Original Williams & Killenger claim at Copper City, and the total yield is $1,588, giving nearly $32 to the ton. Gold seems to predominate in the rock, and both the gold and silver are very fine.

Butte.—The editor of the Marysville *Appeal* has seen a letter from a former resident of Marysville, dated Forbestown, Butte county, April 12th, in which a miner relates how he and his company worked week after week without success, and finally concluding to try one more day, they "struck it," taking out $454, which the editor thinks is better than going to Idaho and living on mule meat.

Nevada.—The *Transcript* has seen some fine rock taken from a quartz vein recently struck three miles above that town on Deer creek. The rock contains a large quantity of ochre, sulphurets, and considerable free gold. The ledge is large and well defined, and we learn that the owners are going to work upon it immediately for the purpose of giving it a test.

A ledge has been opened near Maltman's works, on the Grass Valley road, from which some splendid quartz has been taken, containing large quantities of sulphurets and a considerable amount of free gold. The sulphurets were tested at Maltman's works, and assayed between $200 and $300. The ledge is a foot and a-half thick. The owners are going to put up a pump immediately and sink the shaft down upon the lead, when its value will be tested by a "crushing."

The Lucky Company, according to the *National*, are still in luck. The lead continues to give increased signs of richness. The *National* thinks the claim is worth at least a million dollars, just as it stands. The Union Hill shows no sign of diminution in the gold product, and Howard Hill is no mean rival. Specimens have been exhibited at Findley & Co.'s, from the Badger Company's claim, which contained at least half gold. The sulphuret specimens were of the richest quality, and were taken from sixty to seventy feet down. This immensely productive claim was wholly abandoned a few years ago. If this is not encouragement for investments in quartz mining, what is? asks the *National*.

American Carpet Factories.

The first carpets were made in this country about the year 1824—ingrain carpets—the factory in New York city. In 1834, the establishment was removed to Little Falls, N. Y., and an attempt made to manufacture carpet by power looms, which proved unsuccessful. In 1839, a Yankee named Erastus B. Bigelow, invented a power loom for ingrain carpeting, which was purchased by the Lowell Company, and his inventions are now in universal use.

Messrs. Crossley & Sons, the great English manufacturers, purchased his patents for twenty thousand pounds, and still use them in their mills at Halifax and Kidderminster. Their carpet manufactory at Halifax, England, is the largest in the world, and employs four thousand and four hundred work people. They manufacture nearly every description of carpet, and the product is estimated at many millions of yards annually.

There are at the present time only some six large establishments employed in the manufacture of carpets in this country. Four of these employ a capital of six and a half millions, while the annual aggregate capacity of manufacture of three of them is four million five hundred thousand yards of carpeting of various kinds. Of the four companies just alluded to, one manufactures only Wilton and Brussels carpets and rugs; another only ingrain and three-ply; another ingrain, Venetian and Brussels, while the fourth manufactures velvet Brussels, ingrain, three-ply and Venetian, besides a variety of rags.

One of these companies uses one million two hundred and fifty thousand pounds of wool annually, five thousand pounds of worsted yarn and three hundred thousand pounds of flax or tow yarn. Another, five tuns of wool and two of jute and linen yarn. Another, with a capital of a million and a half of dollars, has two hundred and eighty-eight power looms, and produces over two million of yards of carpeting annually.

In 1857 it was estimated that there were over five thousand power looms in the various carpet factories of the United States, and that there are probably more at present. From one thousand three hundred to two thousand persons find employment in one of these large factories. The sales often reach to several millions of dollars annually. During the first two years of the war the carpet manufacturers found their business better than usual, money being plenty and the people inclined to buy largely. But the unsettled state of financial affairs during the last two years have been felt in the business quite seriously. Though the present tariff almost prohibits the importation of foreign carpets, the duties upon materials are at the same time so high as to vastly increase the expense of manufacturing.—*Cleveland Herald.*

The Queen of Spain has determined to dispose of all her private property for the benefit of the kingdom. It will comprise the whole royal patrimony, with the exception of the royal residences and the estates entailed upon the Crown of Spain. Seventy-five per cent. of the proceeds will go to the public treasury, and twenty-five per cent. to the royal treasury. The sale is estimated to produce 600,000,000 reals. The proposal is said to have been received with indescribable enthusiasm. The whole Congress testified their gratitude by thanking the Queen in person. Her Majesty said that, as she considered herself the mother of the Spanish people, she wished to be the first to sacrifice herself for their interests.

The famous Seminole Chief Osceola was buried in Fort Moultrie, Charleston harbor. A press correspondent, who recently visited the place writes: "Inside of Fort Moultrie is Osceola's grave, a plain slab of marble, with an iron rail-fence. Everything round it had been knocked to pieces by our shells, but not one had touched it or even clipped the flowers around his grave. The inscription on it was: 'To the memory of Osceola, Indian Chief, died in Moultrie, 1838.'"

Tomatoes are kept for years, in France, in a saturated solution of salt. When wanted for use they are soaked in fresh water to remove the saltness. Perhaps the process called "dyalizing" might be useful in freshening them.—*London Grover.*

A Look into the Future.—In the debate in the House of Representatives on the Niagara Ship Canal, Mr. Littlejohn concluded his speech as follows: "Now, sir, twenty-five or fifty years hence, from the Atlantic to the Pacific, will be a continuous tier of States, members of the Union, and over those States will run the iron horse of the Pacific Railroad. Members who reside on the far western coast have also an interest, then, in this highway. The products of Asia, wafted over the Pacific ocean, and then by rail, can be shipped upon the waters of Lake Michigan, and pass to the Atlantic by this great improvement, and the merchandise of Philadelphia, Baltimore, of New York, of Boston and of Portland, will be sent westward over these waters, and will find a way to the coast of the Pacific, and even to China and India, for sale and consumption. And not only that, sir; the time is coming, within the next half century, when this Republic will dictate laws, not only in the arts and sciences, but in pecuniary matters, to the whole world. The moneyed center of the whole world is to be transferred from English to American soil, if we are but true to ourselves and use and develop the resources and advantages bountifully bestowed upon us by nature. England must abandon her lines of communication with her Eastern possessions and become tributary to the lines that we propose to construct between the Atlantic and Pacific. Her business men and emigrants seeking China and India must cross our continent and pay tribute to our enterprise and the genius of our institutions."

The Oil Regions of Humboldt.—The Humboldt *Times* gives a favorable account of the oil regions of that county, which it represents as daily attracting more attention, and drawing thither a large crowd. Additional oil and gas springs are being discovered. Some of the companies have secured many thousand acres. A prominent point of attraction appears to be the banks of the North Mattole and the North Fork, of Bear river. There are also other large tracts of oil producing lands in the interior, and it is confidently believed that the whole region lying between Cape Mendocino and Trinidad Head, back to the summit of the foot-hills, will be found to be rich in this mineral oil.

TO MINING COMPANIES.

A gentleman who has had many years experience in California and Nevada in conducting mining enterprises, and has a thorough knowledge of the business, together with the reduction of Ores, offers his services to any of the first-class Companies whose mines are located in Nevada as SUPERINTENDENT. Satisfactory references given. For particulars inquire at the Office of the Mining and Scientific Press. 17v10-1m

ASSAYERS

Desirous to commence an ASSAY OFFICE in the mines may buy, at a very low figure, in a prosperous mining county, a complete set of Assaying Apparatus, Scales, Chemicals, and everything necessary to carry on said business. Apply to Lock Box No. 752, Postoffice, San Francisco, stating name and where an interview may be had. 17v10

FIRST PREMIUM

FOR REFINING COAL OIL,

At the Mechanics' Institute Fair, 1864.

The PIONEER PETROLEUM OIL WORKS CO. is now ready to advance money upon every kind of Mineral Oil, from five to one hundred thousand gallons, upon assays certified to by Professor E. Benoist. Office Hours—Before 10 o'clock A. M., or between 2 and 4 P. M.

E. BENOIST, Engineer and Chemist,
17v10 643 Third Street, bet. Brannan and Townsend.

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so on most liberal terms, by calling on Mr. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Francisco, April 27, 1865. San Jose, California. 17v10

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, at 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

REMOVAL!

R. WEGENER,

Accountant and Mining Secretary,

Has removed to

No. 415 Montgomery Street—west side,

Between Sacramento and California sts.,

6v10 San Francisco.

It is stated by an English paper that there are twenty boilers under the floor of the House of Parliament, many working at high pressure, and not tested to their strength for years. It might create a deal of excitement, certainly a new sensation for the *blase*, if some morning the reports of parliamentary proceedings in the papers were to wind up suddenly with, "Here the debate came to an end by the blowing up of all the members. A new ministry and opposition with the requisite number of members to work both, will be immediately required."

Thirty Days.—There are many persons who appear not to understand the practice or rule of mourning by placing crape and other insignia on the dwellings. For the information of such, we will say that in all cases, the drapery is allowed to remain for thirty days from the decease of the party sought to be honored.

A young lady is the sole owner of the great petroleum lands in Trimble county, Kentucky. A company of Eastern gentlemen lately proposed to give her $80.000 for the place—which, consisting of eighty acres, would make $1,000 an acre—a handsome sum, indeed, but the fair owner refuses at present to accept the offer.

A distinguished German pianist reported to have died, suddenly, during a soiree, in his apartments, in the Rne de Rivoli, Paris, while playing the same melndy, by Chopin, during the performance of which that compnser is said to have died. It would require Zonave-like piano-forte courage to play it in public after this.

Religion is not the speciality of any one feeling, but the mood and harmony of the whole of them. It is the whole soul marching Heavenward to the music of joy and love, with well-ranked faculties, all beating time and keeping tune.

BLASTNG

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.
Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10q

PREMIUMS.

1st Premium, at Sacramento Fair.....1862
1st Premium, at S. F. Bay District....1863
1st Premium at Sacramento.....1863

Metallurgy.

METALLURGIC INSTITUTE,
McKibbin's Railing Works, First St., Up Stairs
SAN FRANCISCO.
Practical Instruction in ASSAYING by wet and dry methods, Roasting of Silver and other Ores by various methods, according to the character of the ore. Amalgamation, Smelting of rich Silver and Gold Ores, Refining of Silver and Gold-bearing Lead, Blow-pipe Assays and Analysis. TERMS LOW. Chloration of Auriferous Sulphurets taught at an extra charge.
Young Gentlemen desiring a knowledge of the principles as well as the practice of Metallurgy, Mine Surveying, Topographic and every kind of Mechanical Drawing, accepted for a long term at $300. Hours of instruction—From 9 A. M. to 4 P. M.
References—The first Mining Engineers and Metallurgists on the Pacific coast.
G. F. DEETKEN,
Mining Engineer.
Formerly Superintendent of the Chloration Works, Nevada City, Cal.; late of Kustel & Deetken's Metallurgical Works, San Francisco. 14v10

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
The Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. P. KIMBALL, J. R. MURPHY.

A Horse with Spectacles.—The Boston *Advertiser* is responsible for the following: "An old resident of Philadelphia has a family horse which has done good service for twenty years. For some time past the horse has evinced a tendency to stumble, and strain his sight at objects close by. The kind-hearted owner judged the animal by his own case, and ordered of an optician a pair of equine spectacles. A pair of pebble-glasses, about the size of the object glasses of a large sized lunette, were set in a frame over the horse's eyes. He appreciates the convenience wonderfully, and has never stumbled since he donned his spectacles."

Gone Up for Repairs.—The French transport steamer *Rhin*, which arrived here dismasted and almost a wreck from Mazatlan, in tow of the Admiral's flagship *Victoria*, was taken up to Mare Island Navy Yard, to go on the dry-dock, on Monday. The *Rhin* was towed by the little steamtug *Merrimac*, and was in charge of Captain Harrison, the Government pilot. The trip was made, in a dense fog, in four and a half hours.

Suggestion to Fruit Growers.—An exchange suggests that there are thousands of martins in this State, and they will build in boxes the same as in the Eastern States. It is known that they will drive off almost all other kinds of birds, especially the blue jay, which is so bad on fruit. Would it not be a good idea to put up martin boxes about the orchards?

Machinists and Foundries.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

UNASSESSABLE.

First National

PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency, Room No. 20 Government House, SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured Six Hundred and Forty Acres of Land, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Bunoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "First National Petroleum Company," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

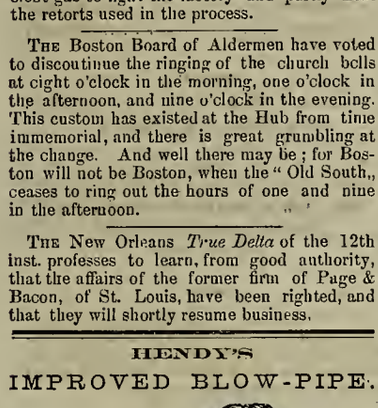
We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10



SEPARATION OF THE COTTON AND WOOL IN MIXED WOVEN FABRICS.—Most of our readers are aware that the wool can be recovered from woolen rags, and worked up again into articles which, if not equal to those into which it was originally manufactured, are yet of great utility. In the same way cotton and linen rags may be utilized in the manufacture of paper, etc.; but the rags of mixed fabrics are of but little value, and can scarcely be used at all without the destruction of one of the constituents, so as to leave the other as unmixed as possible. This is of course a waste to be regretted, especially at a time when the scarcity of cotton presses hardly on paper manufacturers. A process has, however, been recently invented in France, by means of which the flax or cotton can be separated for the use of the paper manufacturer, and the wool for that of the manufacture of prussiate of potash, or Prussian blue, or for the use of the agriculturist as manure. It seems it is particularly valuable as manure, since it is so broken up by the process that it is far more effective than wool in its natural state, which is acted on with difficulty by air and moisture—requiring about two years to render it effective as a manure. It is found that from 1,000 pounds of the mixed fabric there may be obtained 300 pounds of prussiate of potash, and 50 pounds of ammonia, and, in addition to these, sufficient gas to light the factory and partly heat the retorts used in the process.

THE Boston Board of Aldermen have voted to discoutinue the ringing of the church bells at eight o'clock in the morning, one o'clock in the afternoon, and nine o'clock in the evening. This custom has existed at the Hub from time immemorial, and there is great grumbling at the change. And well there may be; for Boston will not be Boston, when the "Old South,, ceases to ring out the hours of one and nine in the afternoon.

THE New Orleans *True Delta* of the 12th inst. professes to learn, from good authority, that the affairs of the former firm of Page & Bacon, of St. Louis, have been righted, and that they will shortly resume business.

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, at the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$6.00.

Sent by mail, if desired. Address

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

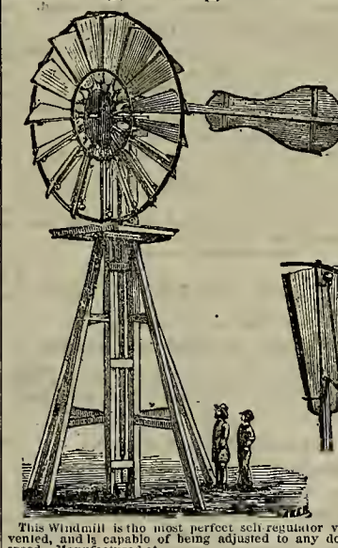
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

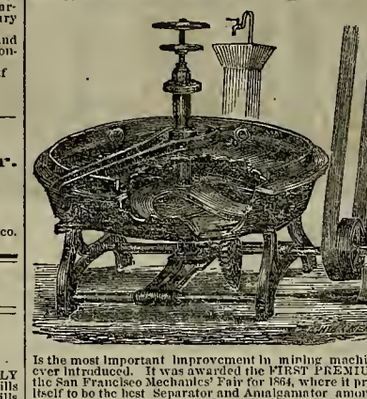
TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 50 pounds of ROCK at a time, and which will weigh about 175 pounds.



The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lavidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address **J. B. BAUX,**

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAKELEE,
O. GOBI,	CEO. JOHNSON,	C. M. RANCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

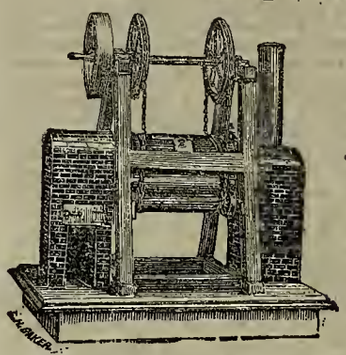
S. E. corner Montgomery and California streets. 19v9

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay.....250	943	Assay 300		990
Assay.....255	941	Assay for Ozotman		980
Assay.....256	940	Assay Water Rock		966
Assay.....291	950	Assay Water Rock		998
Assay.....		.....St. Helena Ledge, W. D.		966



These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by **J. & W. C. SALMON,**

To whom all orders should be addressed. 16

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mulcback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to **W. BRUCKNER,**

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,

—AND—

THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Kustel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 8th, 864.] HEPBURN & PETERSON.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 20, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

WM. H. TOBEY & CO.

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,

No. 543 Clay street, near Montgomery, San Francisco.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.
2. Certificate of Notary that A. B. is Recorder of District.
3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.
4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,
9x10-1m No. 4 Cedar street, New York.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,

No. 338 Montgomery street, Corner of California street, San Francisco. 23x9tfq

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LETCHER, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7vi0-3m

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alteration, which they may desire made in their advertisements, at their earliest convenience. New advertisements should be put in as early as possible.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE or FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

These suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent., including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

STILL PROGRESSING!

REMOVAL.

THE OFFICE OF THE

Mining and Scientific Press

Has been removed to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a

JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for

CHEAP, RAPID AND FINE PRINTING.

We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,
BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

E. D. WATERS, JR., C. W. M. SMITH, } Proprietors. { W. B. EWER, A. T. DEWEY,

PETROLEUM LANDS FOR SALE,

—BY—

WM. H. TOBEY & CO.

SIX HUNDRED AND EIGHT ACRES OF LAND, located in Fresno and Tulare counties, is offered for sale. It will be sold in quantities to suit the purchaser, in forty-acre and eighty-acre lots, or the whole. These lands are choice locations, and considered by judges to be the best in the State. For further particulars, and where Maps and the Crude Petroleum can be seen, apply at

Wm. H. Tobey & Co.'s Petroleum Agency,

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat, pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,

Office Mining and Scientific Press, San Francisco.

A CONVENTION OF INVENTORS.

Mr. S. B. Briggs of New York, an inventor of considerable merit, and one who has also attained success as a manufacturer, suggests through the columns of the *American Artizan* the propriety of calling a convention of inventors, with the view, as we understand him, of effecting some general organization by which inventors may be banded together for the interchange of ideas and guardianship of mutual interests. "Every business," says Mr. Briggs, "has its bands of union, by means of a board of trade, convention, or recognized association of some sort; but the inventors, who number probably 100,000 men, and in which list are found such famous names as those of Fulton, Moore, McCormick, Goodyear, Ericson, *et al.*, have never yet sought to band together for the purpose above specified.

All must acknowledge the propriety of such a movement, as the one proposed, and it is to be hoped the suggestion will be acted upon in earnest, and that California, a State which is doing so much in the line of invention, will not fail to be fully and properly represented.

It certainly is a little singular, as the *Artizan* truly remarks, that the class of men who have in all ages suggested and led the way to improvements, which have already given to civilized communities more than thirty times the productive power of equal numbers in communities that are but partially civilized, and have only hand tools, should of all others be the only ones to neglect the duty of organizing to promote the utility and proficiency of their profession. Several efforts in this direction have indeed been made; but through want of proper energy or concert of action, all previous attempts have failed. It is to be hoped that the present effort will meet with better success. Every journal at all interested in the advance of invention and mechanical progress, should give the project its aid.

One of the principal matters which it is proposed to bring before such a convention is reform in the custom hitherto prevailing of the frequent change in the office of the Commissioner of Patents, and, as a consequence, of the clerks in his bureau. The annoyance arising from this practice and the consequent employment of inexperienced men in the Patent Office, must, of necessity, most materially affect the interests of all for whose benefit the Patent Office has been established. It is manifestly for the interest of both the Government and the people, that skilled and experienced men should be retained in such positions, and that the Patent Office should be removed as far as possible from the deleterious influence of partisan politics, which is inseparately connected with change and uncertainty.

GOOD NOMINATION.—We are pleased to learn that the Union Nominating Convention have selected Dr. Isaac Rowell for Mayor of this city. In our judgment (although we never infere in local politics), the Doctor, if elected, will prove himself the "right man in the right place."

LAKE SUPERIOR COPPER.—The total product of the Lake Superior copper mines for 1864, was 6,850 tons of copper, valued at $6,850,000.

SWANSEA ORE RETURNS.

The La Favorita Mining Company recently shipped a lot of copper ore to Swansea, from which they have just received returns. The following is the result of the sales of the ores at public auction:

	Price ₱ cent	Ton Price	Proceeds
1,176 lbs ore, 48 ₱ cent.	$4 04	$177 92	$84 69
5,432 lbs " 46 "	4 04	185 92	413 88
6,496 lbs regulus 51½ ₱ cent.	4 15	213 75	572 54
3,125 refined bars, 95½ ₱ cent.	4 16	397 92	534 33
			$1,605 44

The ton was reckoned at 2,376 pounds. Considering the low rates ruling at the time of sale and the anticipated advance in copper, the stockholders of the La Favorita look into a bright future.

NEW AND WONDERFUL DISCOVERY.—The Virginia *Union* chronicles the discovery of mines of amalgam, silver and gold held in quicksilver. Mills are not necessary to work the ore; all that has to be done is to scrape the amalgam ont of the rock and retort it. The *Union* is afraid to state the exact sum which this amalgam assays per ton, but it is over $10,000. It may be interesting to say that this wonderful discovery was made in the Green Series of ledges, Pine Mountain District—*Exchange.*

The above mineral, if the statement can be relied on, is probably allied to "Arquerite," a name given to a mineral found at Arqueros, near Coquimbo, south America. As found there it is an amalgam of mercury and silver, with the formula Ag^6 Hg= silver 86.49, mercury 13.51. Before the blow-pipe the mercury volatilizes and the silver remains. The same mineral also occurs in the Palatinate at Moschellandsberg, but with a different formula, varying slightly from Ag Hg^3. It is said to occur at points where the veins of mercury and silver intersect each other. It is also found in various proportions of mercury and silver at Rosenau, in Hungary, Sala, in Sweden, and Almaden, in Spain. It is a very rare mineral. Probably it has never, heretofore, been noticed in any country where silver is found in connection with gold. All the silver found in Washoe, we believe, carries with it more or less gold; hence it might be expected that a vein of *Arquerite*, if discovered there, would carry gold as well as silver.

DURING a short visit to the San Francisco Foundry, on Wednesday, we were shown one of Rix & Logan's quartz crushers, with the working of which we were much pleased. As we hope to be able to give an illustration of this machine in a few weeks, we defer the description which we had prepared, to accompany the cut.

COTTON.—It is stated that the total amount of cotton now in the Southern Confederacy is estimated by good judges to be about five millions of bales. This amount, at $500 per bale, about the present price in New York, would foot up the enormous sum of $2,500,000,000; more than the entire national indebtedness.

REESE RIVER IN NEW YORK.—Dr. A. K. Stearns, an old resident of Austin, writes from New York that the mines of Reese River are attracting much attention in the East. D. E. Buel, Major Bradford, and others from Austin, are in New York, and doing a great deal to engage capital for the development of these mines.

MINING IN AUSTRALIA.—The latest mining news from Australia appears to be very favorable. The quantity of gold dust imported into the Sydney Branch of the Royal Mint, from the 1st of January to the 21st, for the purpose of coinage, amounted to 53,049 ounces. The coin issued during the same period has been 124,000 sovereigns. For the corresponding period of the year 1864, the receipts of gold dust amounted to 22,215 ounces, and the coin issued consisted of 58,000 sovereigns.

The amount of gold dust delivered by the escorts from the several gold fields during the first three weeks of the present year, was as follows: Western, 6,806 ounces; Southern, 10,299 ounces; Northern, 370 ounces. Total, 17,475 ounces.

DIFFERENT KINDS OF OIL.—The Colusa *Sun*, in alluding to the difference in the appearance of the oil obtained from the various localities in that county, says:—

"We are now satisfied that there is but one kind of oil in the district in this county. Dr. George, who has been in that region for several months, is of the opinion that the different colored oil we get is entirely owing to the different chemical substances through which it passes, so that when the fountain is reached it will all be alike. We have ourself noticed places where the oil was thin and clear when it first came out of the ground, and would get thick and dark after it came in contact with the water on the surface.

A NEW GUNPOWDER.—The late gunpowder explosion near London has led to the manufacture of a new gunpowder, the discovery of Mr. L. H. G. Ehrhardt, a German. It consists of tannic gallic acid, or the resin of commerce, and chlorate or nitrate of potash. The new gunpowder is stated to be of three times the explosive force of that now in use, and one-half cheaper. It leaves no residum when exploded. It can also be kept in magazines with safety, by the resin and preparation of potash being kept separate, and mixed as wanted, both the articles named being incombustible by themselves. If it bears the test of actual experiment a saving of one third will be effected; and, the combustion being entire, it will remove all objections to rifled-arms, such as the fouling of Enfield rifles and Armstrong guns.

AN invention has been completed for releasing horses from the traces of carriages. It consists of having the trace buckles so made that the tongue can be drawn backward so as to clear the bar. This is accomplished by means of a lever moved by a strap, which passes up the harness saddle and is continued over the back to the drivers' seat. Should the horses run away with the carriage, the driver has but to pull the strap and the horses run free with all the harness except the traces, which remain attached to the carriage, the vehicle and its occupants receiving no injury.

WE have been shown, says the Copperopolis *Courier*, a few specimens of rock from what the discoverers call a tin lead; the lead is said to be two and a half miles from town, and about seventy-five feet in width. As we are no judge of tin ore, we cannot give an opinion as to the richness of the ore. The Government offers a reward of $50,000 for the discovery of a good tin lead, and California $10,000; so we are told.

SIZE OF WATER-ATOMS.—Can we compute the size of globules of steam, as they are formed at the bottom of a vessel, when the heat is graduated; and assume that an atom of water is twelve times less in diameter than the minutest globule of steam?—*American Artisan.*

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction—A General Review—No. IX.

BY PROF. L. LANSZWERT.

In every treatise of technical import some kind of practical classification is involved; and in a matter of such universal interest as the reduction of our silver ores, it appears to the author of these notes that they should come before our California world with significance enough to command attention in this pre-eminently metallic age.

The production and utilization of metals are intimately allied with chemistry; and considering the immense advantages derived from the application of chemical principles at this time, it is extraordinary to reflect on the comparative excellence to which the art of working rebellious ores had arrived before the aggregation of chemical facts and principles, to which the denomination "science" is alone justly due, had dawned. Chemical science may indeed be said to rest on an historical basis of metallurgic aspirations and metallurgic empiricism.

Coeval with the earliest historical records, some ores were worked, and the operation of working involved the influence of chemical laws; yet the simplest principles of chemistry had not then dawned. At later periods it was alchemy—the vague hallucination of making gold—which prompted men to undertake investigations, fruitful of chemical reductions, to be marshalled into a science thereafter. Metallurgy, then, may justly lay claim to be considered the fountain source of chemistry; and the subsequent development of the science, to the art, might supply the theme of argument in favor of empiricism over intellectualism; if, at various periods within the last one hundred years, the miner and the metallurgist, by their devotion to chemistry, and the chemist, by his successful labors in the practical fields of mining and smelting, had not demonstrated how mutual is the relation between theory and practice—how inseparable for good—how redundant of advantages, the one to the other. Metallurgy, accepting the word in its most extensive signification, derives its best processes, and not unfrequently its best practical aids, from a due appreciation of chemical principles. And on the other hand, the mere theoretical chemist derives a useful lesson of the necessity of checking his theoretical deductions by facts, as they are found to be, by attending to some of the teachings of metallurgy. There are several metallic operations, the success of which is at variance with all theoretical indications of chemistry. "*Corpora non agunt nisi fluida*," was a chemical *dictum* of received universality; nevertheless, the practice of annealing, or the conversion of iron into steel, by combination with carbon, is a practical refutation of the universality. This process consists in the heating together of iron bars and wood charcoal, in a suitable furnace. Both iron and carbon are here brought together in a solid state; both may be said to be devoid of volatility—and almost of liquidity; nevertheless, in violation of the formerly received canon, combination ensues, and steel is made.

A similar disaccordance between the indications of theory and the teachings of practice, is illustrated by the hot blast operation introduced some years ago in the practice of iron smelting. On the other hand, chemistry illuminates many dark recesses in the field of metallic empiricism, and points to faults the existence of which would not have been suspected. It is unnecessary, however, further to expatiate on the advantages which the millman derives from the knowledge and application of chemical theory—the connection being now admitted by none more readily than by the practical metallurgist; and any one to whom is confided the reduction of silver ore must be considered as such. Therefore, before indicating the chemical principles upon which each special process of reducing silver ore is based, it will be desirable to arrange these different ores in classes, according to the several characteristics which they present.

Great specific gravity is so prominent a characteristic of metallic bodies, viewed in the aggregate, that anterior to the discovery of potassium, sodium, and the other alkaline and terrigenous metals, that quality was thought to be inseparable from the metallic conditions. So far, however, is this from the truth, that lithium—the metal of the alkali, or alkaline earth, lithia, (it may be said to be intermediate between the two) is the lightest known solid metallic or non-metallic substance. Based on a consideration of the quality of specific gravity, then, we arrive at a division of metallic bodies into the light and the heavy. In a purely chemical sense, such a division has no value; but it is otherwise to the metallurgist. Inasmuch as the metals of the alkalies and alkaline earths—that is to say, the light metals—are only produced by complex and refined chemical processes, they may be considered as lying without the domains of metallurgy. It is only with the remaining class (the heavy metals), therefore, that the metallurgist has to concern himself, and to which the reader's attention throughout this introduction and review will be exclusively directed.

Contemplating the heavy metallic bodies, in a practical or metallurgic sense, with reference to their subdivision, their various demeanor with regard to oxygen, and their general relations to that extensively diffused non-metallic element, we have a natural as well as a ready means of classification. It has been calculated that almost two-thirds of the weight of our globe—solid, liquid and gaseous, its vegetables and its animals, and its minerals—consists of oxygen. The chemist needs not to be reminded of the powerful tendency to combustion which oxygen manifests, especially with metals. Unquestionably the most considerable, and one of the most important metallic ores, are oxyds or combinations with oxygen. It is natural, therefore, that the metallugist should look, in an examination of the relations of metals, to oxygen, as the basis of their practical subdivision.

Five well-marked subdivisions, founded on these peculiarities, admit of being established. They are as follows:

1. Metals having a strong tendency to combine with oxygen, and to generate bases. These metals admit of arrangement in three sections:

Sec. (*a*).—Metals whose oxygen compounds are basic, or have the property of base. They are zinc, cadmium, lead and uranium.

Sec. (*b*).—This section has only one representative, *i. e.*, arsenic, or arsenicum; a metal the peculiarity of which is, that its combination with oxygen is acid, not basic.

Sec. (*c*).—Metals which form both acids and bases by combination with oxygen. They comprehend copper, nickel, cobalt, bismuth, tin, manganese, iron and antimony.

2. Metals the tendency of which to combine with oxygen is but slight, comprehending gold, silver, platinum and mercury.

The relative fusibility of metals also affords a good means of practical classification. Having reference to this difference, five well marked subdivisions admit of being established.

1. Fusible, and remaining liquid at the lowest heat of temperate climes. There is only one metal which answers to these conditions: it is mercury.

2. Fusible between 392° and 788° Fah., and passing off into vapor when the heat is still further raised. The metals represented by this subdivision are zinc, cadmium, lead, bismuth, antimony and arsenic or arsenicum.

2. Fusible at temperature above 1,830° Fah., copper, silver and gold.

4. Not completely fusible by the strongest furnace heat: Manganese, iron, nickel, cobalt, platinum.

5. Fusible in the hydro-oxygen set: Chromium.

[To be continued.]

The Bakers of Paris.—The bread-making of Paris gives work to nearly three thousand individuals; but each must labor through the night, and sleep when the rest of the world is awake. He must stand for hours between the current of night air and the mouth of the oven. He is thirty years old before he becomes a perfect workman; at forty his strength is exhausted, and he is good for nothing. His sun is a smoky oil lamp; the home of his waking moments a stifling cellar. The air is charged with particles of flour that produce opthalmia. He is cramped with rheumatism, and shaken with a chronic cough, and bears the sombre marks of his forced isolation in his doleful countenance.

Small Arms were in use about the middle of the fifteenth century, but they were miserable things; it took a quarter of an hour to load and fire one, says Hallam, in his "Middle Ages." The soldier had to carry a rest to shoot from. Pistols were invented in the sixteenth century. Gun powder was used to undermine towns in 1487. The exact time when cannon were first used in war is not determined, but Buckle, in his "History of Civilization in England," says, after careful investigation, that they were in use before the middle of the fourteenth century.

Auriferous Quartz Tailings.

Editors Mining and Scientific Press:—I recently became a subscriber to your valuable paper, and can truly say it is indispensable to a miner, more particularly to a quartz miner. I have been a quartz miner, either for gold or silver, from the earliest days of California mining, and one of the successful ones until 1860, when in consequence of the caving in of my mine I was pecuniarily ruined; since that time I have been striving to procure capital wherewith to re-open my mine, which I have good reason for believing to be one of the most valuable in this State. What I know about quartz mining I have learned by close attention. Since I have been taking your paper I have been made to believe that much useful and improved machinery has been devised to save gold from quartz, and hardly any one acquainted with quartz will doubt that great improvements *have* been made since 1860.

Now, Mr. Editor, what I want to get at is this:—I commenced crushing quartz rock in 1853, with a hand mortar and arastra, with mules; later with an arastra driven by steam-power; then stamps by water-power, and in 1857 I had the best twelve-stamp mill that could be procured in the State; but, in 1860, as stated above, our mine caved in and "broke" all interested. From the first, I have been saving and collecting all the tailings, knowing we were losing much gold, (our rock being rich in sulphurets, and having arsenic to contend with,) and expecting there would soon be the right kind of machinery for re-working tailings, of which I have ten thousand tons. A short time since business called me to your city. I examined all or some of the new machinery, and saw many wise men—wise, I mean in saving all the gold from sulphurets and tailings. I conversed with many about this large lot of tailings, informed them how they had been worked and the imperfect amalgamating process we used, which was only copper plates in front of the battery and amalgamation in the battery. In every instance the wise men declared that they could make a fortune out of this pile of tailings, and knew they would pay from eight to twenty dollars per ton. Consequently I was induced to purchase machinery of the latest patent—just the kind wanted to reduce and separate sulphurets from the tailings. Expecting to realize, I tried the tailings, and cannot save the gold.

I have all the power and machinery necessary to reduce and save gold and float quicksilver. Now, if there are any readers of your journal that can make these tailings pay, I will guarantee that they can make more money out of me than in any other business. I will furnish all the power (steam) needed, and machinery free of cost to any responsible parties who wish to enter into a contract to save the gold. The tailings contain five per cent. of sulphurets, and are valuable. In conclusion, Mr. Editor, what use is there of all this new machinery and the improvements we have heard so much about, if I could and did save all the gold that it was practical to save ten years ago? I have always contended that it was a poor business to expend six dollars to get five; I have found it so, not having backers who have made their money outside of quartz mining. Again, if I obtained ten years ago, all that was profitable to save, I am of the opinion that the State of California should make me a donation of ten thousand dollars as the best quartz miner in the State. What say you, Mr. Editor?

A Searcher after Knowledge.

Remarks.—The writer of the above is a responsible party, and has placed his name, with undoubted reference, in our keeping. He has not, however, advised us of the character of the "machinery" with which he has made his unsuccessful effort to obtain the gold from his tailings. If he had done so we *might*, perhaps, point out wherein consists his failure. If, as he represents, he has 10,000 tons of tailings containing five per cent. of sulphurets, worth say, $100 to the ton, they should pay well to work over, at the expense of erecting the necessary machinery. That machinery will involve a furnace, of some description, for roasting or desulphurization. A simple pan amalgamator will recover the gold; or the chlorine process can be adopted, at a cost not inconsistent with the amount of work which he has to accomplish. We can assure our correspondent that if his conditions of quantity and value of tailings is correctly stated, there is money to be made out of the operation. If he has failed at it, he has either been mistaken in his estimate of the value of his tailings, or he has not adopted the right class of machinery. We should like to hear further from him with regard to the experiment he has made upon them.

[Written for the Mining and Scientific Press.]

Letter from Plumas County.

Messrs. Editors:—I have spent some time in this place and vicinity, visiting most of the gold and copper mines around. This valley (the Genesee) is rich in soil, and is in a high state of cultivation, producing in abundance all of the cereals, vegetables and grapes, being one of the largest mountain valleys in the State, surrounded by high mountains full of gold-bearing and copper ores, some of which are well known as the most productive of any in California. Of the incorporated gold companies I would mention the Crescent, Round Valley and Premium, all of which are incorporated in Indian Valley; the Indian Valley G. & S. M. Co., Crescent Extension, and Horse Shoe, incorporated in San Francisco. The incorporated companies are the Superior, incorporated at Chico, Butte Company, Delta and North Superior, at San Francisco, and the Scott, Eclipse and Cosmopolitan at Indian Valley. There are others, not incorporated, of both gold and copper, in this immediate vicinity, many of which, I am satisfied, are equal to those better known abroad.

The belt of gold-bearing lodes seems to run across the west side of the valley, bearing N. W. of S. E. The copper is generally found on the east side of this valley, and running parallel with the gold ledges.

Tennessee creek, running from the east, empties into the valley after coursing across nearly the entire copper belt. This stream is capable of producing a large amount of mill power the year round, on each side of which are innumerable copper ledges. About six miles above this place, and on the south side of the valley, Grizzly creek comes tumbling down the mountain. On this stream placer diggings have been discovered, which are paying from eight to twenty dollars per day to the hand. Hydraulic apparatus are being procured for mining on an extensive scale.

Among the most notable copper ledges is the Cosmopolitan, having a shaft some fifty feet deep and nine by six feet from the top to the bottom of the shaft. I found the entire distance a solid body of copper ores. About two hundred tons have already been taken out of the shaft, some seventy tons of which has been tested in a large furnace erected for the purpose and found to contain from nine to thirteen per cent. of pure copper. Mr. Chapman, who has been smelting the ore for some time for the company, has proved that pure copper can be made from this ore, and informs me that samples have already been sent to San Francisco. A tunnel has been run on the east side of the ledge, which is now two hundred feet in the mountain, and will strike the Minerva three hundred and twenty feet from the surface. It is calculated by Messrs. Kelly & Co., proprietors, that the ledge will be reached by running this tunnel about seventy feet further. Another tunnel is being run several hundred feet below the shaft, directly on the ledge, intended to connect with it. When the lowest level reaches the vein it is believed a rich strata will be found. This immense body of mineral, the width of which is not known, but traceable by its croppings over two thousand feet, may eclipse some of our Copperopolis mines. With every facility of wood and water in abundance, the ore, as already proved, can be economically reduced. Plumas county ranks deservedly among the foremost in mineral as well as agricultural wealth of any in California.

Taylorsville, April 17, 1865. L.

The President and His Brother.—The editor of the Reese River *Reveille*, who seems to be well acquainted with the Johnson family, says that a brother of the President is now publishing a paper in Texas. He learned his trade as a printer in the Raleigh (N. C.) *Standard* office, the publisher of that paper having adopted him on the death of the boy's father. President Andrew Johnson, like Andrew Jackson, is of Scotch and Irish descent, is a native of Raleigh, (N. C.), and aged fifty-two years.

Thirty Battles.—It has been decided that the 1st Maine Cavalry is entitled to bear the names of thirty actions on its regimental standard, which is eight more than can be claimed by any other cavalry regiment in the Army of the Potomac.

ENCOURAGING.—The following is the concluding portion of a private letter addressed to the publishers of this paper from San Jose. We give it merely as an example of many similar instances of kind wishes expressed in behalf of our efforts by our numerous correspondents:—

I must wish you success with your enterprise. There is always something to deeply interest the general reader as well as the miner, in your paper. I hope it will become one of the institutions of the day, especially as a source for interchange of facts and discoveries among the miners, inventors, and searchers after knowledge throughout the world, and especially on this coast. I am deeply interested in the Arizona news, and can appreciate with what pleasure others feel on receiving intelligence from their favorite localities. Your paper is evidently one of the wants of the age. Again let me hope it will be enabled to take a proud position among the journals of the world. Believe me,

Yours truly,

H. C. S.

SATISFACTORY RETURNS.—The first-class ores from the Colorado river country sent over to Europe for smelting have thus far yielded much more heavily than was anticipated, and the reputation of that country has advanced accordingly with great rapidity. Some of these ores yield enormously, and even the second and even the second and third class ores are found to pay handsomely, over all expenses of mining, transportation and working. The average yield of the Planet ore, from Bill Williams Fork District, has been over 40 per cent. in copper alone, and the ores of other Companies located lower down the river, are yielding as richly in copper, with considerable amounts of silver and gold. A lot of the second class ore from the Great Central mine, Weaver District, which the Superintendent, Mr. Thompson, did not feel certain would pay the expense of shipping and working, sold in Swansea at between $90 and 100 per ton after careful analyis, which rate would leave a profit to the Company of nearly or quite 100 per cent, over all expenses' or in other words return $2 for every dollar invested.

IMPROVED HELICAL TURBINES.—Mr. J. E. Stevenson, hydraulic engineer of the Broadway, New York, has invented an improved turbine, which combines the helical curve with the Jonval wheel proper in a neat, compact, and portable form. The helix is so constructed that the velocity and force of the water acts upon all the buckets at once; the *vis viva* of the water is not loss by friction on the sides of the helix before acting on the wheel. The step is made of hardened steel, and is of peculiar form; it is placed above the wheel, resting on a stationary spindle inside the hollow shaft, which the wheel is keyed to, thus doing away with the large wooden step below the wheel, which causes a lost of power by friction. In the hollow shaft is an opening suitable for oiling and adjusting the step, and also for regulating the bight of the wheel to the helix by means of a screw and nut, so as to prevent loss of water from leakage. There can be no loss of power by the rubbing at the periphery of the wheel, caused by the lateral wear of the step, as in common scroll wheels after running a year or two. The power of the wheel can be perfectly regulated by the gate, and when machinery is thrown on and off an ordinary governor will keep a uniform speed. These wheels are applicable to all mill powers, and the inventor claims that when properly put up and geared 80 per cent. of the useful effect will be obtained. The inventor having had twelve years' experience, and being long connected with extensive works, must have given him an ample opportunity of removing the defects usually complained of.

IMPROVED REVERBERATORY FURNACE.—An improved reverberatory furnace invented by Mr. E. B. Wilson, of London, England, has been for some time in use at the establishment of Messrs. Moreland & Sons, of that city. The same improvement is also about to be adopted by the Glasgow Iron Company. This company consumes about 3,000 tons of coal per week, and the saving of fuel which the new system promises to effect in the event of its being applied throughout the works, must be an important consideration. Mr. Wilson has also been operating on furnaces at the Blochairn Ironworks, and at Motherwell. It is stated that the invention can be applied to a puddling-furnace at cost a not exceeding $20 The bottom of the furnace being made quite close, the door formerly used for putting in fuel is sealed up, and in its stead an aperture is introduced in the top, at the end farthest from the chimney, Through this aperture the fuel is passed, the feeding being so managed that the passage is kept full of small pieces of coal. It is on this opening also that the furnace depends for its draught, the only air allowed to enter being that which passes through the interstices of the coal.

THE MIRACLE OF NATURE.—We shudder when we look on a corpse, cold, inanimate and still, and involuntarily we ask, is it all ours? Can a bright immortal be evolved from such a wreck? My friend is dead! I stand by his corpse. Yesterday he was with me. Brilliant thoughts awoke in the confines of his now dissolving brain, scintillating like gleams of light. Yesterday he solved difficult problems in mathematics and intricate judicial questions. He expressed emotions worldwide in their being. I saw his children on his knees, and they met in those eyes the glance of love, the smile of affection those eyes now glazed and sightless. I stand tottering on the dreadful brink of eternity; I have approached the awful precipice where life's cord is broken, and beyond—ah! hush my soul!—beyond! Mortal eye sees not a step farther—mortal ear hears no echoing sound of the arrest of the mortal precipitated over that brink! Before us lies a wreck. The heart capable of making three thousand million beats without stopping—has at last paused forever—capable of universal thought and Godlike energy of exection, is now silent. To-morrow, brain, heart, all this mortal stature, like marble ground to powder, will be scattered over the world by the winds, and a million hungry beings will make those atoms their own! Is there a resurreetion!

Nature each year demonstrates the resurrection in the revolving seasons.

It is winter, and animate nature is dead. Earth and water are changed to a crystalline rock. There is no rain, only frost—the congealed damp on the brow of this corpse—snow the burial garment of vitality. Look you out on the frosty landseape; there is a pitting wind and the leafless trees are swayed like hoary skeletons moved in mockery of life. The sap in their veins is stone. A few animals, protected by the forethought of man; and man himself, by superior wisdom and the control it gives him of the elements, survive.

Look out on the frozen world, and say if anything were more completely dead! There is nothing active but the wind, and that seems the infernal breath, blown from an unknown source, by which nature was destroyed.

If to this scene we add one element—heat—everything bounds into life; the shroud vanishes; the stream dances down the meadow, bordered with green and bright flowers; the trees clothe themselves in emerald: birds carol in the branches; the little lumps of stone turn into insects and reptiles, chirping in the foliage or bathing in the sunshine. Suddenly there is a resurrection of life in exuberance of terms, and plenitude of power.

Each year we have seen this miracle of the seasons, greater, by far, than the resurrection of the spiritual from the immortal.—*American Union.*

MAKING UP A NEWSPAPER.—The difficulties in making up a newspaper are often of a very practical character. Every week something is to be left over, and somebody is to be disappointed, not to say chagrined or offended. Only an experience in a printing office can explain the matter. A paper of huge dimensions is every way easier to edit than a small one. You can throw into its capacious folds articles and documents unabridged, but one of small or medium size has to be manipulated with the tenderest care, else you will lack variety, will leave out important paragraphs, will have a superfluity of words and a scarcity of sense. In our last week's issue we meant to get in a good many things that did not get in. The exhortation of patience is always in order; also that of brevity. Think of the fact that your epistle is not the only one written or to be written—that A, B, C, D, down the whole line of the alphabet, is waiting to come in, and that if you do not shorten, somebody will be shut out. To print in detail would be to destroy the general variety of the paper. Write as often as you think there is need, but choose words with the same care that you would if sending dispatches over the wires at fifteen cents per word.—*Christian Advocate.*

GOOD FOR AN IRON SHIP.—The Monitor Monadnock recently arrived at Hampton Roads in seventy-six hours from Port Royal, towing the steamer Mohican a portion of the way, the latter having been broken down off Cape Hatteras. When our iron ships can thus not only take care of themselves at sea, but also help wooden vessels, it is pretty good proof that they may be made sea-going craft, if they are not already such. Another disagreeable little "straw" for France and England.

THE ORIGIN OF THE SMALL-POX.—The small-pox is believed to have first appeared in Arabia in A. D. 579, about the time of the birth of Mohammed; and an Abyssian army which afterwards besieged Mecca was obliged to raise the siege in consequence of its ravages. Arabian physicians of the tenth century wrote about the disease, and various writers discussed it during the following centuries, though Boerhave was the first who insisted that contagion was necessary to its propagation.

Life.

The following beautiful disquisition upon life, says the Philadelphia *Evening Bulletin*, occurs in a sermon delivered by Rev. E. E. Adams, in the North Broad street Presbyterian Church, in that city:

"There is life in the lichen that clings to the shaded rock, and drinks the cold drops of the mountain; there is life in the fire-fly that lights up the marsh with his evening ray; there is life in the lark that hails the orient sun with a psalm more sweet, and not less glorious, than the notes of Haydn and Beethoven; there is life in the lion who shakes the wilderness with his terrible roar, sending horror through every wild pulsing heart; there is life in the eagle as he sits in solitary grandeur on his alpine hight, or sails on steady pinion above the clouds that crown the Andes; there is still higher life in speechless child just opening its eyes to the light, and with pure lips in its first smile; there is life in boyhood, glorious in its fresh ambition, in its untamed aspirings; there is life in girlhood, the charm of beauty and innocence playing on the cheek as if the smile of God were there; there is life in manhood, and in the herculean arm, in the brow that rivals Jove's, and the eye that shoots out the fire of Mars. Measure, if you can, the mental life of Plato!—the depth and compass of Webster! Fathom the intellectual and moral depths of Moses and Paul. Take the life of humanity; let it be represented by all its best qualities in a single human being. Give him the frame of Sampson, the intellect of Lord Bacon, the soul of Payson or St. John, the beauty and grace of Alcibiades, the song of Handel or Mozart, the oratory of Cicero, or Pericles, or Clay, the devotion of Daniel or Paul, the executive genius of Alexander, the science of Humboldt the statesmanship of Washington, and the social nature of Burke, the muse of Shakespeare, the chivalry of Gustavus Adolphus, and the piety of Daniel or of Joseph—and let him stand forth among his species to defend, to enlighten, to win.

Let him shed his great light over the earth. Let him reform Governments, revolutionize customs, awaken thought, inspire devotion, banish abuses, elevate life and fill the age with new, inspiring, grateful, holy sentiments, feelings and resolves. Let him impart something of his great nature to humbler mortals; let him speak in majesty and tenderness to us, and be before us the way, the truth and the life—the highest standard of manhood, the living depository of all human greatness and goodness—all that is mighty in the arm of man, all that is profound in his intellect, all that is precious in friendship, all that is sublime and blissful in holiness—and I will tell you that the life of Christ is infinitely more! Angels cannot reach it, seraphs cannot know it; it is the life of God dwelling in the soul; it is holiness that no spot darkens—love that fills every capacity and expels every fear. It is eternal life in fullness, in variety, in beauty, in strength, in joy, in duration. If there is anything rapturous in song, anything exalted in character, great in thought and achievement, it is in this life."

EFFECTS OF CHAMPAGNE.—The intoxicating effects of champagne are rapid, but exceedingly transient. This arises partly from the carbonic acid which is evolved from it, and partly from the alcohol, which being suspended in the gas, extends itself rapidly over the stomach. In cases of weak digestion, champagne is one of the safest wines that can be drank. We know of remarkable instances of persons who, having been prostrated by illness to almost the last extremity, were resuscitated by taking champagne. We are not talking of its curative but of its restorative powers. We have no faith in general panaceas, but can certify that in particular cases champagne has been admirably useful. We speak of facts within our knowledge, of three cases of ladies who were reduced to such a state of prostration, that, in the opinion of physicians, their existence was only a question of a few hours. As a *dernier resort*, champagne was ordered to be taken in each case, and the restoration commenced immediately. We do not say the disease was cured, but fresh vigor was supplied to the weakened frame, and the stomach, thus getting into order, was enabled to digest nutritious diet. In this way the powers of nature may be so assisted as to afford reasonable hope of ultimately overcoming disease.—*Charles Tovey.*

HOME SMELTING.—The Copperopolis *Courier* states that Mr. Meader, having become satisfied that the ore from the Union mine can be smelted in Copperopolis as well as Boston, contemplates erecting extensive smelting works two miles southwest of that place. The amount of money paid by the Union Company for sacks alone is very large, and the freight on ore to Boston and Swansea is enormous. The expense of sacking the ore is also heavy. First, second and third-class ores can be reduced here at a saving of a bushel of gold each year. At least, this seems to be the general opinion.

Inactivity.

If a steam engine is stopped suddenly and left unused for a long period, the piston rusts fast in the cylinder, the packing corrodes the rods, and dust thickly covers every part.

When the human frame is inactive and torpid for a length of time the muscles relax, the nerves lose their tone, the organs refuse to perform their functions, and the whole of that great machine—the human frame—is disorganized.

Day in, and day out, men sit poring over ledgers and day-books until they are addle-headed, and the figures swim before their eyes. When evening comes, and business hours are over, instead of taking a walk so as to send the blood dancing and tingling to the remotest part of the frames, they drop into some car and drowsily roll to their doors. A very great portion of the minor ailments flesh is heir to is caused by laziness.

An afflicted individual goes to a doctor: "Something is wrong inside," but he does not know exactly where. Thereupon the physician looks grave, and says, "Ah! Dyspepsia;" and forthwith orders tonics, drastic purges, and what not, when all the lazy man wants is a two mile tramp in the Central Park, or a good old-fashioned jouncing on a hard trotting horse.

A certain eastern potentate, feeling himself out of sorts on one occasion, sent for his physician and demanded a cure.

"Take this mace," said the physician, "then mount a horse and swing the instrument back and forth, riding meanwhile at full gallop. Certain drugs concealed in the handle will then exude; your excellency will absorb them and be cured." And he was, says the legend; the shrewd man of medicine knew full well that all the king required was fresh air and exercise, and he took this method of prescribing them.

It is better to wear out than to rust out, and shoe leather is far less costly than medical advice.

Stretching the legs relieves the tension on the purse-strings, and the cheapest as well as the best medicine for dullness, head-aches, blue-devils, stupidity, hypochondria, ill-temper, and total depravity, is fresh air and sunlight. These are sovereign remedies, but because they are easily obtained, do not taste bad, and cost nothing, few use them.

RELIGION AND HEALTH.—Henry Ward Beecher, in his Lecture Room Talk in the *Independent*, thinks that health is the first step towards a healthy religious experience. He says:

"You will say, perhaps, 'What, then, is there no religion for the infirm and sick?' Yes; but that does not alter the fact that in their religious experiences they are more or less gloomy or desponding. It is not always the effect of disease to produce gloom and despondency; sometimes it hightens the sensibilities; but as a general thing religious experiences are sounder and more rational in a healthy body. So I say that as the first step, you must be healthy if you expect to have broad and deep and sweet experiences. Health is a Christian duty. I have heard persons praying, and praying, for the presence of God, and I have thought that, if they would eat less and work more, and spend twice as much time in the open air, they would not need to pray so much. What they wanted was not answer to prayer, but simple obedience to the laws of God and nature."

DISASTROUS COAL-PIT EXPLOSION—FIFTY-SEVEN LIVES LOST.—A terrible explosion of fire-damp took place in the St. Catherine coal-pit, Dour, Hainault, on the 3d of January. From some cause the inflammable gases in the pit were ignited just as the men were about leaving their work, and in a moment a strong column of flame was seen to rush out of the principal shaft, seize on the ropes, the machines and the roofs, and with the rapidity of lightning the building erected over the shaft was in flames from one end to the other. As soon as practicable, and indeed before it was possible to descend the shaft, efforts were made to rescue the living, recover the bodies of the dead, and ascertain the extent of the mischief caused by the explosion. It was known that 117 miners had been in the pit at the time of the occurrence, and the greatest anxiety therefore prevailed amongst the large number of persons to know the fate of relatives and friends. In a comparatively short time forty-two bodies were got out of the pit, and it was believed that some sixteen or seventeen more remained to be found. Several other persons sustained injuries more or less severe. Only last year seventeen men lost their lives in this same pit in consequence of a similar explosion.

ANCIENT DOCUMENTS.—Report says that the lost books of the Annals of Tacitas, relating to the reign of Caligula, have been discovered in Catania, in pulling down an ancient edifice

ORE.—Several hundred tons of first-class copper ore is awaiting shipment at the Copperopolis mines.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, May 6, 1865.

The money market is well supplied with available capital, and former rates still rule in Bank—1½ ₱ cent. per month upon first-class business paper and other unexceptional collateral. In stock circles an active demand continues at 2½@3 ₱ cent. per month, and the recent decline in nearly all shares has for the moment impared confidence in this description of security.

Receipts of treasure from the interior since Saturday last amounted to $1,100,000, and gold bars have been in good demand at 840@850. Silver bars are ruling at 1 ₱ cent. premium to 2 ₱ cent. discount.

Legal Tender Notes have been well maintained during the week, and the sales amounted to $283,500, advancing from 71⅛c to 72½c, receding to 71½c, rallying again to 72¾c, and closing at 72½c bid, 72¾c asked.

Our latest telegraphic advices from the East quote gold at 142.

Since our last issue the Mining Share Market has exhibited extraordinary animation, and nearly every stock on the list met with a serious decline. The panic still prevails, and is attributable in some degree to recent unfavorable developments in certain portions of the Comstock lode and to the sale of a large amount of hypothecated stock to cover advances.

The severity and suddenness of the fall in prices seems to bewilder most operators, and until this feeling subsides and a little reflection is given to the real character of some of these mines, it is reasonable to anticipate great caution and even timidity on the part of those who are disposed to invest in them.

Yellow Jacket declined from $2,260 to $1,980, rallied to $2,000, receded to $1,880, then sold at $1,850, and closes at $1,730 bid, ex-dividend of $100 per foot paid yesterday, 136 feet changing hands. The product of the claim has averaged 300 tons of ore per day during the week. The southern end of the mine shows some improvement, and other portions of the lode are said to be looking well.

Savage fell from $1,900 to $1,560, seller 30, advanced to $1,690, receded to $1,590, rallied to $1,600, and sold yesterday at $1,580, ex-dividend of $75 per foot. The receipts of this company for the month of April were in excess of those for the previous month, and after the payment of a dividend, a surplus of some $10,000 remained at their credit in bank. Nearly $80,000 have recently been expended upon the new hoisting and pumping apparatus now in course of construction, and the payments required for their completion are to be made as the work progresses. These improvements are to be of the most efficient character and will exceed in power anything now used in Nevada.

Gould & Curry has been sold to the extent of 35 feet, at rates steadily declining from $1,900 to $1,590, then at $1,500, less the dividend of $75 per foot, and closing at about $1,525 asked. The yield of bullion last month exceeded $200,000, and during the week the receipts have been up to the usual average. No change has taken place in the upper portion of the mine, and the drift is not yet underway from the D street shaft.

Belcher has been a conspicuous feature of the market, and 120 feet were sold, declining from $1,550 to $1,180, rallying to $1,200, dropping to $890, and closing yesterday afternoon at $1,025. The sudden depreciation of this stock has been a subject of much comment in stock circles. So far as we are informed the present appearance of the lode in the lower level north of the shaft, is not flattering, and efforts will now be made to find pay ore at a greater depth; meanwhile, it is said, that a considerable quantity of ore can be taken from the upper levels.

Crown Point fell from $1,210 to $1,000, rose to $1,165, dropped to $1,075, and sold at the close at $1,050. Within this range 60 feet were sold. Receipts of bullion for the month of April amounted to $38,000. In the 230 feet level, the lode north and south is improving, and the pay portion is now 8 feet wide and 150 feet in length. The company will commence sinking 70 feet deeper next week, and the new hoisting machinery is then to be in operation. Four mills are now employed in the reduction of 65 tons of ore per day. Mr. F. G Taylor, formerly of the Best & Belcher mine, has been chosen superintendent of the Crown Point Company.

Alpha has proven about the only exception to the decline in all other stocks, advancing from $980 to $1,050, and closing at $980; some 30 feet changing hands. The lode in the 535 feet level continues to improve and is now some 15 feet in width in good ore. The upper levels are also looking better. A recent crushing averaged about $60 per ton.

Challar has been extremely active and 384 feet were sold, steadily declining from $775 to $480, rallying to $505, and closing at $497½. The incline running southwest in the 5th level of the north mine discloses a better quality of ore, and the shaft sunk from the 4th level in the south mine has, it is said, penetrated good ore. About 150 tons, averaging $45, are now daily hoisted to the surface.

Potosi was dealt in to the extent of 145 feet, declining from $785 to $520, then selling at $365, and closing at about $550. The product of this claim amounts to some 160 tons per day, and different portions of the lode are looking as well as ever.

The Challar-Potosi Company are perfecting arrangements for the adjustment of all the debts of the two companies, but nothing definite has been determined upon as yet. Mr. A. K. P. Harmon has been elected President, and Mr. W. E. Dean Secretary of the consolidated companies. The uniform courtesy and efficiency of these gentlemen gave, we believe, entire satisfaction to the stockholders of the old Challar Company.

Empire Mill & Mining Company is in more favor, and is well maintained, advancing from $485 to $500, buyer 30, declining to $480, rallying to $490, and closing at about $490. This company have a surplus of some $30,000 on hand, and will probably declare a dividend next week. The north and south claims are both giving evidence of improvement.

Hale & Norcross declined from $500 to $390, and closes at $370 bid. Ophir steadily fell from $525 to $345, and sold yesterday at $375; in all, some 82 feet changing hands.

Minerva dropped from $345 to $215, and closes at $210. Work upon the shaft is being continued, and an assessment of $100 per foot has been levied upon the stock of the company.

Uncle Sam fell to $250, rose to $275, buyer 30, again declined to $250, and closes at $245.

Confidence (G. H.) was dealt in at $170 per share, and is now held at $155. A dividend of $100 per foot has been paid for the month of April.

Imperial rose from $295 to $305 per share, fell to $275, and is now held at $280, ex-dividend of $10 per share paid yesterday. A cross-cut is now underway, running south, at a point fifty feet east of the Alta shaft, and thus far it discloses as good ore as has been found in the main drift. Washoe advices speak very favorably of the future of this mine.

Bullion fell from $162½ to $140, rallied to $150, buyer 30, and closes at about $142½. Some 100 shares were sold. Burning Moscow has been comparatively steady, and 700 shares were dealt in at from $47½ to $41.

Nevada, (J. G.) declined from $62 to $45, rallied to $51, and is held at the close at $48. Wide West fell from $11 to $8; Sierra Nevada declined from $24 to $15, and Daney dropped from $20 to $14.

The aggregate sales of Stocks and Legal Tender Notes, since Saturday last, amounted to $1,580,910.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

Saturday, April 29.

72 shs Ophir at 525 per foot.
1 sh Savage at 1912½ per foot.
1 sh Savage at 1900 per foot, s 30.
2 shs Savage at 1950 per foot, b 30.
4 shs Savage at 1900 per foot.
10 shs Potosi at 775 per foot.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by transacting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public properly as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by pursuing a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of a solicitor in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device, or some other invention for a similar purpose. But partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of such notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as Secretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it tersely.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as rast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of an article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is considered in our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, steel-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3½ yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of equal honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

Mining and Scientific Press.

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past year.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, May 6, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Atlantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

DESULPHURIZATION OF THE ORES OF THE PRECIOUS METALS.

A large amount of attention is now being paid by inventors to the subject of a more economical and effectual mode for roasting or desulphurizing the pyrites found in the ores of silver and gold, for the purpose of releasing the precious metals which they contain. The great expense attending the process has hitherto induced most miners to neglect this important portion of their ores, and millions of dollars have consequently been suffered to run to waste in the tailings of our quartz mills, a large portion of which has passed off in the sulphurets. Within the past four or five years however, there has been a tardy acknowledgment of the wastefulness of this practice, and furnaces are now being here and there constructed for the purpose of utilizing the sulpburets; yet the tediousness and cost of employing the ordinary reverberatory hearth is rendering this reform so slow, that none but the most valuable ores can be successfully operated upon.

We have already described, in the columns of the PRESS, several ingenious contrivances designed to simplify and cheapen this process, one of which, patented by Mr. Bruckner, of this city, has been illustrated. We have also, described and made extended notices of the Keith Process, which has been in practical operation for nearly two years in the Colorado mines.

THE WILSON PROCESS.

Of late we have noticed numerous efforts in this direction undertaken by metallurgists at the East. Dr. Riley P. Wilson, of New York, has recently patented an apparatus which is highly spoken of. It consists of a series of fire-clay retorts, cylindrical in shape and arranged one above the other, and all enclosed and made to revolve in a large furnace, the fire being applied below, the heat and flame passing up and around the cylinders. These cylinders are heated to a cherry red, when the sulphurets are introduced into the top one, which is so constructed as to automically discharge into the one next below, and so on through the series, the last discharging into a water bath. During the process a current of air and steam combined is caused to constantly intermingle with the ore, causing a more rapid and perfect oxydation. The construction and operation is such that no loss can ensue from vaporization or currents of air as in the ordinary reverheratory hearth. The whole arrangement is compact, and not very expensive. Crushing and triturating machines accompany desulphurizing machines when required.

THE WHITE PROCESS.

A later invention is that put forth by Geo. W. White, of Boston. We have not seen any full description of this apparatus, but it is spoken of as being very simple and effective; the desulphurization being effected by the direct application of the flame to the ores. It is claimed that each machine is capable of calcining twenty-four tons of sulphurets in twenty-four hours—a claim so improbable as to throw a strong shadow of doubt over the entire proceess. It is reported that the inventor is about to start for California with one of his machines. Should it arrive here, we shall take the earliest opportunity to examine and report upon its merits.

THE CROSBY PROCESS.

There is still another method of desulphurization, known as the "Crosby Process." This process purports to have been eliminated from practical experiments at the Excelsior Co.'s mine in Colorado. These experiments were conducted on a large scale, and upon ore taken from a great number of lodes. In the course of these experiments, the inventor claims to have discovered the fact that gold exists in its ores in two conditions—as a native metal and in a condition from which it is readily volatilized at a moderate temperature. This latter condition is supposed to be that of a sulphide; and moreover that tbe volatile is the normal condition of the metal, while its "native" form is merely accidental. Accepting this theory as true, the inventors of this process argue that the sulphides must be all lost by the usual process of desulphurization. They furthermore claim that in many of the sulphuret ores, the sulphides represent three or four times as much as that held in mechanical connection with the sulphurets. Acting upon this theory, Messrs. Crosby and Thompson have devised a process of desulphurization by which any escape by evaporation is rendered utterly impossible. We propose, next week, to give a full description of this process, which will probably be followed up with a careful examination of the philosophy and practicability of the same.

FORCE EXERTED BY VEGETABLE GROWTH.—Some idea may be formed of the force exerted by vegetable growth from the fact stated in reference to an enormous specimen *Agbricus cartilagineus* (mushroom), which was recently sent to the British Museum. It was found growing below the pavement in the Goswell road, and its *mycelium*, or filamentous body, from which this fungus growth is developed, which, in this case, was developed into an enormous spongy mass, had, in pushing up its many-headed pileus, raised a stone weighing *two hundred weight*, and measuring four feet square.

VERY PROPER.—The Government has decided that the motto, "In God is our trust," shall hereafter be stamped upon all coin issued from United States Mints. This is a proper recognition of the Great Creator who has so wonderfully shaped the destinies of this nation, and preserved it from dangers which human foresight and human strength could not have averted. It has hitherto been stamped on the two-cent piece, only, and is the first and only recognition of God which has ever appeared upon the Federal coinage.

PAPER PIPE.—The Portage (Lake Superior) *Mining Gazette*, says that paper pipes, six inches in diameter, are used in the Pewabic copper mine to convey air from one portion of the mine to the other. The pipe is six inches inside diameter, the paper being one-fourth of an inch thick. The pipes are quite strong and can be joined perfectly air-tight by a strip of canvass and a coating of tar.

INDUSTRIAL SCHOOLS.

A wealthy gentleman of Worcester, Mass., has offered to give $100,000 toward the establishment of a free school of "Industrial Science" in that city, on condition that suitable grounds and buildings shall be provided by the citizens. The offer is a munificent and most praiseworthy one. It is quite time that the industrial sciences should begin to receive more consideration at the hands of our wealthy patrons of learning. While our institutions for classical literature and the various learned professions, are constantly receiving princely endowments, in addition to a most extensive and liberal public patronage, but comparatively little thought has been bestowed upon the important class of education contemplated in such institutions as the one above proposed. Such a condition of things is contrary to the spirit and need of the age. Industrial schools should be as numerous as our colleges. Denominational zeal and local interest and pride have thickly dotted the land with the latter; perhaps, however, not more thickly than is needed by our people. But surely we can now forego, for a while, their further multiplication, and devote our means and energy to the establishment of the equally, if not more generally useful, class of schools of the description known as industrial, rather than classical. Let us have schools of mines, schools of agriculture, naval schools, mercantile schools and schools of general industry, where our miners, our farmers, our seamen, our merchants and our mechanics may be especially fitted for their various avocations. The progressive spirit of the age imperatively demands such institutions. The era of invention and industrial improvement has now reached a point at which it is impossible for our people to maintain their equality with other nations, except by similar means to those here proposed. The industrial schools of England, France, Germany, etc., will soon place America in the background, unless she provides for her industrial classes those incentives and aids which are accomplishing so much among the nations of Europe.

The Pacific Railroad.—The Pacific Railroad is now open and in running order from St. Louis to Lawrence, Kansas, from which point it proposes to push forward and join the Central Railroad approaching from the Pacific side. On this side, the work of grading and track-laying is also advancing rapidly into the mountains. At Newcastle Gap, a bridge one thousand feet long and sixty feet high, and, last beyond, another, of nearly the same dimensions, have been completed. Among the heaviest pieces of work is the Bloomer Cut, twelve hundred feet long and sixty-three feet deep, presenting two walls composed almost entirely of cobble stones, solidly embedded in cement. The managers feel confident of running the first engine to Illinoistown by the 1st of October. We see no reason why the West and East should not join their iron rails inside of another decade.

The Amazon.—The late reported discovery that the river Amazon has been found to be navigable nearly to its source; that, in fact, a new route has been opened between the Atlantic and the Pacific, assumes a new interest since the starting of the new exploring and scientific expedition into that region, under the direction of Prof. Agassiz. This new highway through the Andes will undoubtedly be particularly examined and reported upon by this expedition. Should the discovery prove to be what is claimed for it, it will be of far more commercial importance than the discovery of the source of the Nile, the efforts to accomplish which have occupied so much of the scientific interest of the world for the last twenty years.

The Best.—The Chicago *Tribune* says the best wine produced in the United States is made at Burlington, Iowa, from the Catawba grape. It resembles Rudesheimer, of the Rhine, and Burlington has several large vineyards of this class, cultivated by Swiss and Germans.

The Planet Copper Mining Company.—At the annual meeting of the stockholders of this company, held on Monday last, in this city, the following gentlemen were chosen officers for the ensuing year: President, S. J. Ashley; Secretary and Treasurer, J. C. Hutchinson; Superintendent, Richard Rylund; Trustees, S. J. Ashley, William Patton, James McClosky. The mine of this Company is located in Williams' Fork District, Arizona Territory. The company was incorporated about a year ago, and has been taking out ore since November last. About 450 sacks have already been received in this city, which assayed forty-four per cent., and upon which assay it was sold. There are now 2,500 sacks *en route* to this city. During the progress of the work upon this mine a peculiar deposit was recently encountered, which was considered at the time of no value, and many tons of it were thrown away as waste dirt. A small portion, however, was brought to this city by the Superintendent, and submitted to assay. It proved to be an oxyd of copper, intermixed with lime, and in such a condition that it can easily be separated by washing, after which it will assay from fifty to sixty per cent. The cost of separation will not exceed six or eight dollars per ton on the ground, where they have plenty of water for the purpose. They have not less two hundred tons of this mineral in sight at the mine, hitherto believed worthless.

We understand that the company are obliged to pay thirty-three dollars per ton freight, for their ores, from the river to this city, which added to nine dollars cost of land carriage from the mine to the river, insurance, storage, etc., brings it up to over fifty dollars per ton. Of course, at such a price none but the richest ores can be brought to market. We understand that the transportation company express a willingness to bring the price down to twenty dollars from the river, as soon as freight is presented in large quantities. It appears to us that it would be for the interest of the company to reduce their freight at once, as an inducement for shipping a lower grade of ore, which would at once greatly increase the quantity which would be sent forward. There are quite a number of mines in the vicinity of the Planet that are thinking of commencing work. It would need but a little encouragement, in the way of a reduced cost of freight, to open up a very large traffic over this route.

Slate Range District.—We have received several very fine specimens of ore at the hands of Mr. A. B. Warner, Recorder and one of the pioneer prospectors of the El Paso Mining District. The specimens are from the Slate Range District, some thirty five miles beyond El Paso. A few lines from our old correspondent, "C. W. T.," who has been engaged for some weeks in the Slate Range District, informs us that J. W. Searles, Superintendent of the Rochester Cons. Gold and Silver Mining Company, has lately added five new stamps to their old mill, making now thirteen in all. The mill works finely and gives the fullest satisfaction. It has all the work it can possibly do. The Rochester lead is now well opened, by three tunnels running in on the lead, from 100 to 150 feet in length, and over 100 feet apart. An incline is opened from the upper to the lower tunnel, and choice rock is now discharged through it from the different chambers to the wagon road below, from whence it is carted to the mill, about one-half mile distant. Formerly all the rock from the upper chamber was conveyed to the foot of the hill on pack animals, which are now dispensed with. Messrs. James & Jeffery have contracted to get out all the rock required to supply the mill night and day, and are delivering about fourteen tons per day. The amalgamating is all done in the batteries, only one or two pans being in use to work the sulphurets, which are caught on blankets. We understand from Mr. Warner that the thirteen-stamp mill, above alluded to, is run by steam, the fuel for producing which consists of sage-brush only—four loads of which run the engine twelve hours.

A farm without fruit producing trees and plants, is like a house destitute of the smiles and joys of childhood.

CALIFORNIA PETROLEUM INTEREST.

We understand that oil has been discovered on Bell's ranch, about fifteen miles below Half-moon Bay, where oil had previously been discovered on Purissima creek.

The new steamer Del Norte, which started on her first trip up the coast on Wednesday, took up, to Humboldt Bay, machinery for boring for oil on the ground recently purchased for the purpose by Levi Parsons and other prominent capitalists of this city. Operations on Mattole creek will be commenced as soon as the machinery can be placed on the ground.

The North Fork Oil Company is the title of a new organization which filed its papers of incorporation on Monday. The object of the company is to conduct the business of boring for oil in the Mattole mining district, Humboldt county, California. Their capital stock is $500,000, which is divided into 5,000 shares of $100 each. Their business will be managed by a Board of three Trustees, which, for the first three months, will consist of Thomas G. Richards, B. Reinhardt and Joshua Lyon.

The Wilmington (Los Angeles) *Journal* of April 22d, says that the Los Angeles Petroleum Oil Company commenced to drill by steam on the Saturday previous, and on Tuesday night were down fifty feet. From present appearances, they will be down 100 feet within a week from the time they commenced boring. For eight feet below the surface the hard, black asphaltum found at the top continued; after that they reached a hard, blue, sandy clay, in which they were still working. Through all this clay there are veins of asphaltum, an inch wide down to a mere thread-mark, apparently forced up to the surface by gases from below—the asphaltum being thinner as they go down. When the mud is removed by the sand-pump an oily substance is seen floating on the surface of the muddy water, presenting varied hues. Some gentlemen from Pennsylvania visited the well lately, who pronounced the indications favorable. The progress of the work was attended with considerable interest. Many ladies and gentlemen called to see the works daily. Important developments may be expected at an early day. A correspondent of a morning cotemporary, writing at a date subsequent to the above, says that on the 28th ult. they were down 130 feet, and sinking at the rate of fifteen feet a day. The bore at that date was in a tough clay. A large amount of oily matter came up with the clay, which is taken out with the sand-pump.

A Los Angeles correspondent of a city cotemporary says that there is a flattering prospect that the first dividends declared from the recently discovered oil lands and petroleum springs about Los Angeles, will be received by the lawyers. Lands supposed to rest upon the city bed, have been located under the National and State Homestead and Possessory Acts, and re-located as mines under mining laws. The owners of ranches held and located under Spanish and Mexican grants, are loosening the bonds by which they were fastened upon their oily beds, and are slewing and sliding them about hither and thither, to make them cover this and that oil spring, or some tract of oil land, which had been located, bought or taken up by some prospector.

The Great Mass of Native Copper which was discovered in one of the Lake Superior copper mines a year or more ago is still in process of extraction. We have seen no statement of the amount which has been removed, but presume it must amount to many tons. The Portage *Mining Gazette* says, that the average weight, per cubic foot, of that which has already been shipped, has been 420 pounds. Work about the mass has been prosecuted sufficiently to admit of a pretty accurate measurement of the bulk of that which remains, which is stated to be twenty-five by thirty feet in length and breadth and two feet thick. This would give a cubic measurement of 1,500 feet, and a weight of *three hundred and ninety tons.*

Orange Trees in San Francisco.—Mrs. Richards, at the Mission, has a large number of orange trees in full bearing at this time.

Rainwater a Cause of Consumption.

Under this head, Prof. J. V. Philips, a geologist of some eminence, now residing at Dubuque, Iowa, writes the *Times* of that city an article, in which he maintains the use of rain water, to the exclusion of lime water, induces and is the cause of consumption. It should be read with considerable interest. He says:

A fact has been developed by Liebig, the great animal chemist, in reference to the origin of consumption that is not generally known. In analizing the blood of all persons of pulmonary complaints he found a lack of lime in the blood. And this led to the natural conclusion that consumption was not a disease, but nothing more or less than the breaking down of the system for the want of elements to build it up. A very curious fact in relation to this complaint is, that consumption in the United States is confined principally to the granite and sandstone districts, where there is no lime held in solution with the water, and a line drawn around these rocks encloses all the principal consumptive districts in the States. The same rule applies to children teething. If a nursing mother wants to have trouble with her children teething she has only to avoid food that contains lime and drink rainwater, and when the period arrives for the child to have teeth, the whole energies of its little system will be brought into action to eliminate lime sufficient to grow teeth, and this effort of nature produces the irritation known to mothers as the "teething period."

It is evident that persons who have compounded the hundreds of nostrums to cure consumption—few if any of these men had the remotest idea of the causes of this complaint, and consequently their preparations would generally do harm in the place of good—and it is not unreasonable to say that there are more medical properties in one barrel of spring water from one of the springs about Dubuque, where the water boils up from this coraline limestone, holding in solution lime, magnesia and other mineral matter in such condition as can be taken up by the absorbents of the stomach, and eliminated throughout the organization, than in a car load of "pulmonies" and "panaceas." Also that if one of the rivers, the Maquoketo, Turkey, or other rivers of Iowa, that rise and flow through purely coraline limestone regions could be turned through New Jersey and the New England States, and the people drink of its water for one generation, that consumption as a hereditary disease would end.

A Valuable Map.—Mr. A. J. Doolittle has placed upon our table a valuable and reliable map of Humboldt county, in this State, which is worthy of a place in every business office in San Francisco. The map has been published under the especial direction of the Board of Supervisors of that county, and has been prepared with unusual care and attention to the minutest details of its filling up. The locations of all the principal mineral, coal and oil discoveries, up the time at which the map was ready for the draughtsman, are carefully noted, and the boundaries of the timber, swamp and agricultural lands plainly defined. A large amount of valuable historical and statistical matter has also been placed upon the map. The growing oil interest in that section will probably do much to secure a large sale for the map. The Supervisors of Humboldt county are deserving of much credit for the aid which they have thereby given in developing the geography of the State. If each of the counties in California would do as much, an amount of exploration would be accomplished, and noted down, which could not fail to be of great public interest and value. Persons or public bodies having such work in view could not find a better man in the State to undertake its accomplishment than Mr. Doolittle.

Silver Peak.—A late number of the *Reveille*, after describing the extraordinary rich silver mines lately discovered in that region, gives the following description of that country: "This mountain lies almost directly south of Austin, according to late reports, and distant about 150 miles. The mines are in the south-eastern end of the mountain, and look out beyond upon the desert that leads into Death Valley, which none can cross, and which is more than 400 feet below the level of the sea.

Mariposa Estate.—The Mariposa *Gazette*, says that this estate has passed into the hands of the Dodge Brothers, of San Francisco. The company had become so embarrassed by the large attachments levied upon their personal property as to render a change in the management necessary.

QUICKSILVER AT MOUNT DIABLO.

One of the most promising mineral locations in Contra Costa is the quicksilver mine near the eastern base of the main summit of Mount Diablo. This mine has been known to the Indians from time immemorial. A very aged Indian, who has given up the roving habits of his race, and "located" in the vicinity of this mine, says that from the time of his boyhood all the Indians in that region have been in the habit of resorting to that place for obtaining the red paint, (sulphate of mercury) with which they were accustomed to bedaub themselves on all occasions of great festivity or when preparing for battle. The same use, it will be recolleeted, was made of the same substanee at the New Almaden mine. So little attention was paid to mining matters about Mount Diablo, that it is only quite recently that the value of this mine has been brought to the notice of capitalists. It was first located by Mr. Welch, who, in connection with several of his friends, took it up a year or two ago. They ran a short cut into the face of the hill, and sunk a shaft some thirty-five feet in depth on the ledge, at which point they cut through the vein, which was thus proven to be continuous and about ten feet in thickness. This shaft was partially filled up at the time of our visit to the mine. The ore is very rich, the quicksilver being brought freely to the surface whenever the ore is exposed for a short time in a fire. Repeated assays of average rock have uniformly yielded most satisfactory results. The vein rock proper is accompanied with a large amount of earthy matter, known by the Mexicans as "tiros," precisely as it is found at the New Almaden mine, near San Jose. A large amount of free quicksilver can be washed from this earth by the ordinary pan process, securing, at the same time, large quantities of pure sulphuret of mercury, in the form of fine crystals, like sand. It is said that a man can make fair wages by merely panning out the native quicksilver. It may not be out of place in this connection to state that the party of Mexicans who were employed to do the work above alluded to, and who were old employees of the New Almaden Company, proposed to take the mine and open it thoroughly by tunnels and shafts for extensive working, and take merely the ore which they might raise for their pay—thus making the mine pay for its own development. The proprietors did not see fit to accept their offer, but preferred to associate themselves with capitalists and develop it on their own account. As a further evidence of the richness of this mine, it may be noticed that a small stream of water, which runs down the mountain, the most of the year, across the vein, has been taken up as a quicksilver *placer*; the locators intending to sluice out the bed of the stream for the free quicksilver, and the large deposit of rich boulders of ore and finely divided sulphuret sands which abound in the same. A handsome prospect of quicksilver can be obtained from a panfull of earth, taken up at random, almost anywhere in this stream, for two or three thousand feet from the mine. The holders think they have got a "good thing" of it, and will commence operations as soon as the next rainy season sets in.

The original owners of the mine, which is called after its locator, the "Welch Claim," have made an arrangement with Mr. Ogilsby, a capitalist, well known as the owner of the Ogilsby road over a portion of the Sierra, to put up furnaces and the necessary machinery for working the mine. The work of putting up this machinery has already commenced, and we understand the retorts will be ready for work in about two or three months. Experts and persons who have long been connected with the working of the ores of the New Almaden mine, say that this is quite as promising as that was at the start. The millions of profit which have been derived from the Almaden make the proprietors of the Welch claim almost fancy themselves millionaires also. We trust they may become so in reality.

Three extension locations have been made upon the north and one upon the south of the origiual location, known as the Union Company, which presents quite as well defined a vein as that of the original Welch Company, and much more favorably located for working; beyond which there is no appearance of the vein, and, indeed, such is the formation of the mountain, that there is scarcely a possibility of its being found any further. Some work has been done on the southern extension—a short cut run, in which the vein is exposed, and a location made for a tunnel, at a point which presents a most favorable opportunity for a thorough opening of the vein at a very moderate cost.

The location of this vein is very favorable for profitable and economical working. It is situated within three or four hours' ride from San Francisco, and within eleven miles of good water communication, over nine miles of which there already exists an excellent and almost perfectly level county road. The other two miles are now being constructed by Mr. Ogilsby, who, by the way, is famous for building good roads. We shall not be surprised to see Mount Diablo, before long, presenting a formidable rival to the Old and New Almaden mines, which have for so many years controlled the quicksilver market of the world. This discovery, should it prove as valuable as it now promises to become, will be most opportune; for the present increasing demand for this prime necessity for working ores of the precious metals is calling loudly for a new and additional source of supply, without which, the mining public may well fear a monopoly which may, at no distant day, exert a disastrous influence on the world's supply of gold and silver.

ANOTHER CHROME GREEN.—A brilliant green for printing is said to be made in the following way:—Take 15 parts of biehromate of potash, 36 parts of erystallized phosphate of soda, and 6 parts of tartaric acid. Fuse the phosphate in its water of erystallization, and add to it the biehromate ruhbed to fine powder, and afterwards the tartaric acid. Great frothing takes plaee on the last addition, and the color of the mass changes from yellow to green. A porous brown mass remains, which dissolves in hot water and dilute acids, giving an emerald green solution. The porous mass is to be moistened with as much strong hydroehlorate acid as it will absorb; it is then treated with cold water to remove the acid, and afterwards with boiling water to dissolve out the soda and potash salts. An insoluble green body remains on the filter, which, when more finely divided by levigation, becomes of a brighter shade. The 6 parts of tartaric acid may be replaced with 14 parts of Rochelle salt.

THE FIRST NEEDLES.—Needles were first made in London by a negro from Spain, in the reign of Queen Mary, about 1554. He died, however, without imparting the secret of his art; and it was lost till 1565, when it was recovered in the reign of Queen Elizabeth. It was one Elias Growse, a German, who taught this useful art to the English. The manufacture of needles was literally lost to England for nearly a century; but about 1650 it was recovered by Christopher Greening, who settled in Long Crendon, in Buckinghamshire. The reputation long enjoyed by Whitechapel needles points out the particular locality in London where the manufacture was once carried on. At the present time the largest number of needles are made at Reddich, in Worcestershire; at Hathersage, in Derbyshire; and in and near Birmingham. The product of Reddich and its neighborhood alone is very great. Even several years ago it reached 100,000,000 needles per week.

FLATTERING A PHOTOGRAPH.—A method has been recently suggested softening the effect of photographic pictures, and removing the too faithful harshness with which they render some faces; or, in other words, of introducing a little flattery into photographic portraits. According to the *Photographic News*, M. Mathey suggests the following method:—"The plan is to have a lace curtain stretched on a wooden frame placed between the camera and the sitter; the further the curtain is from the model, and consequently the nearer it is to the lens, the softer the features appear; the threads of the lace give the grain of a chalk drawing or engraving, and the defects of the model are modified and softened down."

MORE than thirty patents were issued in the last six months of 1864 for inventious relating to petroleum, such as drills for boring wells, devices for removing a paraffine and other obstructions from the veins of the rock, pumping and raising oil, barrels, etc.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

REVISED EVERY ISSUE.

A BREAD riot took place at Idaho City, April 2d. Flour was selling at $40 per hundred pounds. So says the Idaho *World*.

THE powder mills in Santa Cruz have resumed work, having been thoroughly repaired since the late explosion. The mills are now turning out the best quality of blasting, sporting and rifle powder.

MILLING.—A new flouring mill is nearly completed at Marysville, by A. D. Starr. The engines and boilers are from the Marysville foundry, and are said to be of fine workmanship.

Mining Summary.

WASHOE.

The Gold Hill *News* reports a decided improvement in the mining interest in that vicinity, and notes the healthy and steady advance in the price of leading stocks as an evidence of the fact, as also an extension of operations in the old working companies, and a vigorous prosecution of work upon claims which have for twelve months past been lying idle. These evidences are patent to all, and admit of no misapprehension as to their import. Moreover, this confidence is not altogether confined to citizens of Washoe, but the real worth of her mines is beginning to be more fully appreciated abroad. Foreign aid is coming forward with a most encouraging promptness. As a result of this condition of things additional stimulus is being given to outside operators, and prospecting has in several instances been rewarded by valuable discoveries.

Copper.—Speaking of the late copper discoveries, the *News* says: The ledges from which these specimens were obtained are situated near Walker river, and about fifty miles from this place. Dr. Collins and J. C. Swain located the claims during the present month, under the names of "The Finnim" and "Gertrude" companies. Of course but little labor has yet been done towards the development of the ledges, but at a depth of four feet from the surface the lode is two feet in width, and assays made of the ore show it to contain sixty per cent. of copper, and silver and gold in minor quantities. The immediate country is very barren, and no water is to be had except at the river, twelve miles distant, while fuel and lumber of all kinds is equally scarce. It is the intention of these fortunate locators to commence the development of the ledges forthwith. A force of men will be put at work, and smelting works will be erected on the nearest portion of the river bank.

A New Mill.—The Dayton *Sentinel* says: Mr. Chas. Morgan, of this place, will have charge of the mammoth mill about to be erected by Messrs. Carpenter & Birdsall. Mr. J. R. King is to be the superintendent of the mill when it is completed. Messrs. M. and K. have had considerable experience in their particular branches. The Union Iron Works of San Francisco have contracted to furnish machinery. The proprietors contemplate having the mill in operation by the middle of next July.

The Yellow Jacket Company have purchased the fine new mill of James Morgan, on the Carson road, near Empire City. The mill has thirty stamps, and is driven by water. The mine now keeps some fifteen mills employed.

In drifting east, the Imperial Company, Gold Hill, have struck a very extensive and splendid body of ore, 520 feet below the surface.

ESMERALDA.

We are without our usual files from Esmeralda this week; but learn from a correspondent that very rich placer diggings have been struck in Oweas River Valley, near what is known as the "Big Pine," the consequeace of which has been a regular stampede of the miners for Montgomery and Blind Springs.

REESE RIVER.

Messrs. Pryde and Cook are the fortunate discoverers of a very rich though narrow lode lying near the Oregon mill in Upper Austin, to which they have given their name. An incline upon it shows the ledge to be ten inches in thickness. Nearly all of it, however, is rich chloride and sulphuret ore. Some very fine specimens are obtained, both of ore and quartz crystals.

According to the *Reveille*, Mr. M. W. Robinson, one of the pioneers of Austin, has lately returned from San Francisco, where he has organized a company under the name of the New World Mill & Mining Company, for working mines in Smoky Valley. A mill has been purchased designed to run by water, and when completed will be a sixteen-stamp mill.

A prospecting party has discovered a new mining country, two hundred miles south of Austin and east of Death Valley, Nevada, where they found excellent indications.

HUMBOLDT.

The Sheba mine is working away lively again, with about forty men, and increasing their force daily. The mine is looking well and so do all the indications. A large body of ore is said to have been struck, of which the workmen are taking out eight tons a day. The mill was to have been started on the 5th inst. to work this ore, the proceeds of which is to go towards paying the indebtedness of the company. It is said that the principal cause of the late trouble with this mine has been the fact that the company has kept too many men prospecting. They have spread over too large an area underground, instead of confining their operations to taking out ore and gaining in depth.

CALIFORNIA.

The San Jose *Courier* says that there are some fine copper mines being opened in the mountains near San Jose. Among them the Margurita is the most prominent. Fine specimens of cinnabar have also been found in the neighboring mountains some miles from the Almaden mines. Our mountains hold untold millions of mineral wealth. To those who have money to expend in prospecting, the *Courier* would say, expend it in the mountains near where you can occasionally enjoy the comforts of civilization. Very good advice.

The *Sentinel* says that Mr. Fleck has just constructed a very convenient, cheap and portable quartz crusher. It is built at a cost of four hundred dollars, can be worked with two-horse power, and will crush three tons in twenty-four hours. It is running, attached to the machinery of his grist mill.

Amador.—The *Ledger* says that a Sacramento company have commenced the erection of a quartz mill at Irishtown, three miles below Pine Grove, and that the Tellurium company are building an eight-stamp mill directly at Pine Grove.

Shasta.—The *Courier* thinks too little is said and known of the mineral wealth and prospects of Shasta county. The only really extensive hill diggings yet worked are at Horsetown; but a bill a short distance away having been recently prospected and found to pay, has aroused the miners to action and a company was formed in Middletown, which after a little prospecting has obtained results which have surprised the most sanguine, at a point two miles from that place. The dirt prospects from top to bottom. Important developments are expected to grow out of their prospecting operations. Erastus Dickinson, of Freach Gulch, has discovered and located a rich gold-bearing lode of quartz near that town. It is supposed to be a continuntion of the Highland, which has been paying so richly.

Jollie & Co., have sold their quartz mill and ledge, on Clear Creek, near Muletown, for three thousand dollars, cash. The mill is a three stump one, without amalgamating pans or other apparatus than an arrastra for amalgamating the gold and quicksilver. With this imperfect machinery the new company produced in a week's run, amalgam sufficient to make a bar, the assayed value of which is $432. Miserable county, this, says the *Courier*, exultingly. No money in it. People ought to leave immediately for Red Bluffs and Idaho.

Nevada.—Our Nevada exchanges still come freighted with their usual quantity of mining items. The *National* says that the Mammoth mine, located on the north side of Deer creek, is now in full operation. The tunnel is in about 600 feet. According to the *Transcript*, a ledge was struck at Grizzly Hill, a few days since, of extraordinary richness. A flour sack full of dirt taken from around the lead yielded sixty dollars. One pound of rock, a specimen, of course, paid twenty dollars.

A company which has been mining for the blue gravel lead for four years, at a point near the trail leading from Jefferson to Snow Test, struck the lead a few days since, and found a dollar to the pan. This lead is supposed to be a part of the great belt of blue gravel, which runs from Minnesota, in Sierra county, through to Washington, and thence across the country, intersecting the blue lead of Little York township. From this lead millions of dollars have been taken.

Messrs. Neece & West, on Brown's hill, have their mill nearly completed. Collins & Co., on the adjoining ground, have the timbers all out for their mill.

The *Gazette* says that Mr. Merrill, of Omega, recently took out 118 ounces from some "worked-out ground," which he thought he would run through his sluices before commencing upon the solid bank. Mr. Williams cleaned up $1,600, a few days since, from his cement claims at Red Dog. This is the manner in which the mines are "giving out" in that region.

Messrs. Smith & Co. have finished their new sixteen-stamp mill at Rough & Ready. They took out $750, a few days since, from fifteen tons of rock brought to them by Messrs. Eberlein & Gove—a net profit of $500 over all expenses of mining and milling.

Placer.—Some lucky parties have discovered what promises to be another rich ledge near the Grass Valley road, about six miles from Auburn.

Great Entail.—An Illinois farmer named Israel Funk recently died, providing by will that his vast estate should remain in his family undivided. He was possessed of 30,000 acres of the best land in that State, and taxed for $2,000,000.

Modern Means of Information.

It may be worth the while to pause a moment and contrast the present means of information with the restrictions that curbed the human mind within the lapse of a comparatively short period. Who will look over the library of some antiquarian, will detect a corpulent compilation of leaves which are fashioned of parchment and the chirography painfully coursed by the human hand.

During the middle ages, the learning of Europe was almost entirely confined to the denizens of the monasteries. With the arrogance of ignorance, the proud lordlings would superciliously summon the shaven priest to their presence when the necessity arose for the transmission of some written message. A military adventure or the song of some errant minstrel, were the only means of knowledge of lands beyond their own. Of the great Past, with its throbs of enterprise and glory, men and women knew nothing save from hazy legend. The intellect was torpid, and greed, and revenge, and tyranny, and lust were the controlless passions. It is a matter of wonderment, the topics of conversation in palace or bower in those dark and untutored days. The mental gloom was Cimmerian. Beneath the belted warrior and the courtly dame, the great masses were serfs, whose possessions and lives were at the beck of their self-constituted superiors.

We wot there has been some change since that gloomy period. To be sure the Arcadian vision of old dreamers has not been realized; for there are poverty, crime and remorse in the most favorable sections. Yet in civilized lands at the present moment there is no attitude or phase of the human family that excludes any character of information. Learning, however abstruse and complicated, is forced upon every comprehension, however reluctant. Say, if you please, there are regions where adults have been unable to secure a knowledge of their native written tongue. The interfusion and contact of their intelligent fellows force upon them the accretions of their superiors. There is not a sane man in the United States who has not pretty accurate knowledge of planetary movements, and the laws of tides and seasons. He knows much of the geography of the earth, and the habits of and manners and government theories of all nations.

The printed sheet is accessible and penetrable as the atmosphere. Very widely diffused is the modern gazette — become as much a necessity to the humblest and forlorn as the morning meal—and how diversified are its teachings? It has literary breathings from the most polished of every land. It utters every matter of scientific research. It gives the reverberation of distant wars, and the quarrels and amenities of the potentates of the earth. It engorges us with the past, with its deeds of daring and crime. It reveals the present as if by the unfolding of a scroll. Through its columns the electric wire pulsates, obliterating space, communicating the most distant event the moment of its transpiration.

The press has become to the people of our generation as was Mephistopheles to the German Faust, conveying all manner and variety of wisdom. It multiplies volumes with greater rapidity than the ephemeral insects their brood of myriads. So far as the dissemination of learning and fact is concerned, it is no harm to be plunged in the gulf of penury. Information is upon the wings of each breeze. It has no cloister now. Front de Bœuf, had he lived and rioted and oppressed in our day, could have found a "clerk" to pen his missile in the first ragged urchin in his pathway.

The Singer Manufacturing Company.

We clip the following notice of one of the leading commercial features of the grand inauguration procession in New York, March 6th, from *Frank Leslie's Illustrated Newspaper* of March 25th:—

The Singer Manufacturing Co.—This company made a display in the procession—which we illustrate elsewhere—commensurate with the magnitude of its enormous business. They turned out one six-horse team, decorated with red, white and blue plumes, drawing a truck, upon which was erected a pavilion, covered and draped with the national colors, and in which eight young ladies were engaged in operating the Singer Sewing Machines, in the manufacture of army clothing. On either side of the pavilion was inscribed the following unique and telling motto: "We *clothe* the Union armies, while Grant is '*dressing*' the rebels."

Following this was a four-horse team gaily dressed, and two tandem teams, drawing the wagons of the company, loaded with Sewing Machines, directed to some of the principal branch houses located in the several quarters of the globe, the whole preceded by a full band and escorted by 1,000 men, employees of the company. The men marched in platoons, with guidons, indicating the respective branches of the business to which they belonged. Altogether this was doubtless one of the most attractive, as it was the most extensive, display of trade by any one establishment in the city, and we doubt if it could be exceeded by any in the world. It is in keeping, however, with the well-known patriotism of the Singer Manufacturing Company.

Another Labor Saver:—The Iowa *Horticulturist* speaks of a hay and grain loading apparatus, recently invented by Lewis Dorbin & Co, which has been for some time in actual use in that vicinity. The apparatus is attached to the hinder portion of an ordinary farm wagon, and professes "to take up and load hay as left by the mower, without raking, cocking or pitching. Also to load grain, flax, etc., without the labor of binding and shocking, thus saving at the present prices of labor at the East from $17 to $20 per day.

Quartz Mining Laws of Sierra County.

At a meeting of the quartz miners of Sierra county, held at Downieville, on the 6th day of June, 1859, pursuant to a published call for the same, William Illingworth was elected Chairman, and Alfred Helm, Secretary.

On motion of E. Irwin, a committee of three was appointed by the chair, to draft by-laws for the regulation of the quartz interests of this county.

The chair appointed Lewis Reynolds, Monroe Thompson and Alfred Helm said committee, with instructions to make their report at 7 o'clock P. M.

Seven o'clock P. M.—Meeting called to order, and the committee reported the following by-laws, which were unanimously adopted, viz:

Art. 1.—A claim on any quartz ledge in this county may have a length of two hundred feet along the same, and a width of two hundred and fifty feet at right angles, with the ledge on each side of the same, to include all quartz found within the above mentioned limits.

Art. 2.—Any person discovering a gold-bearing ledge, not previously located, shall be entitled to two claims, being one claim for discovery.

Art. 3.—No person but a discoverer shall be entitled to hold more than one claim, by location, in a company.

Art. 4.—No one but an American citizen, or a foreigner who has and exhibits his Foreign miner's tax receipt, shall be allowed to hold a claim by location on any quartz ledge in this county.

Art. 5.—It shall be necessary for claimants to post a notice on some conspicuous place on the claims located, setting forth the number of feet claimed, and from what point, upon which the real names of the locators shall appear in full. Said notice shall hold good for ten days, at the expiration of which time a copy of said notice shall be placed upon the records of this county. The notice and record as above, shall hold said claims, without further improvements, from and after the first day of November, until the first day of May following, if recorded after said first day of November. But upon all claims located between the first day of May and the first day of November following, labor to the amount of eight dollars per claim shall be expended toward the prospecting or developing the same in each, thirty days after such location.

Art. 6.—To hold quartz claims for the first twelve months after location, it shall be required of each claimant to expend at least one hundred dollars upon each claim of two hundred feet, in such improvements as may be required in the development of the same.

Art. 7.—Quartz claims which have been duly located in accordance with the foregoing rules and regulations, persons are entitled to hold without limit as to number, by afterwards conforming to the requirements set forth in these by-laws.

Art. 8.—All quartz claims in this county, heretofore located, upon which no permanent improvements have been made, will be declared forfeited within thirty days after the publication of these by-laws, unless the notice of location is renewed and recorded, if not already upon the records of the county and labor expended upon the same in accordance with the foregoing regulations for holding quartz claims.

Ventilating Mines.—To ventilate mines by means of steam and heated air, without the use of open fires and furnaces, has been provisionally specified by Messrs. Evans, of Cefn Mawr, and Griffiths, of Merthyr Tydvil. They propose to erect, contiguous to the upper part of the upcast shaft, a tower or structure open at the top (except as hereafter stated), and they lead from the lower part of this hot-air tube in communication with a fire-clay pipe, formed at one or each side of this furnace in the form of a channel, the air in the pipe being thus heated in the furnace, and supplying the interior of the tower in the lower part; and they prefer to carry a steam-pipe from the top of the said steam-boiler into an upper point of the said tower, at the end of which steam pipe they provide a steam-box, with a ring of jet-pipes projecting upwards, and at the top of the tower there is an inverted cone, for regulating the draught. The bottom of the tower is made inclining to the center, so as to form a drain, to carry off any condensed water. Instead of placing the furnace and boiler outside the tower, or structure aforesaid, they can have it, or portions of it, placed within the tower. —*London Artizan.*

Rings.—The introduction of this little ornament is of great antiquity. At first rings were made of iron, but shortly before the Christian era, those of gold began to be worn. The ring is believed to have been intended as an emblem of fidelity; and to have been thus used in variety of cases. During the Middle Ages it was recognized as the credential of a mission. Wedding rings are supposed to have originated with the Jews, and the custom to have been adopted from them by the early Christians.

According to Napoleon, Cæsar was quite a lady's man. He dressed with exquisite taste, either shaved or had his whiskers pulled out every day, and wore his hair most artistically, each lock being in its particular place. He always displayed a red scarf about his waist with peculiar affectation.

The monument to the memory of Addison C. Whitney and Luther C. Ladd, of the 6th Massachusetts, who were killed while passing through Baltimore in 1861, was dedicated with appropriate ceremonies, on the fourth anniversary of the event, the 19th day of April.

Distinguished Arrival.—Dr. C. P. Jackson, the eminent *savan*, and for many years State Assayer and Chemist of Massachusetts, arrived in yesterday's stage from the west. This distinguished gentleman, we understand, visits our country to examine into its mineral resources, the fame of which is spread through the land. We trust that our citizens will extend every courtesy possible to Dr. Jackson and his companions, that they may make a thorough examination of our mines, and their favorable reputation be maintained.—*Reese River Reveille.*

Enjoining a Sale of Mining Stock.—J. P. Hoge, S. M. Wilson, Alfred A. Cohen and John Williams have brought suit in the Fifteenth District Court against the Sheba Gold and Silver Mining Company, to restrain defendants from selling the stock in said company, advertised for sale as delinquent. Plaintiffs allege that a portion of the previous assessment of thirty dollars per share, on stock belonging to W. M. Lent, one of the Trustees, has never been paid, nor any attempt been made by the company towards enforcing its collection, and that the subsequent ten dollar assessment, being the one now under consideration, is necessarily void and illegal. An injunction was issued in accordance with the prayer of the complaint.

BLASTNG

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.
Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10-y

PREMIUMS.

1st Premium, at Sacramento Fair.....1862
1st Premium, at S. F. Bay District....1862
1st Premium at Sacramento.....1863

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
The Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. P. Kimball, J. R. Murphy.
10v10

G. E. MOORE,
Assayer and Analytical Chemist,
Having established a Chemical Laboratory, furnished with every requisite for delicate Analytical work, is prepared to execute the Assay and Analysis of Ores, Mineral Waters, Guanos, etc., with accuracy and dispatch. No. 334 Montgomery Street.

To Make Cuttings Grow.—Prof. De Lacroix, Besancon, France, says: "Cuttings of roses, apple, apricot, pear, plum and others, if put ont in June, after his method, will grow. He takes a cutting long enough to let its two ends be well bedded in the soil, and a bud in the middle close to the ground, grows well. These cuttings should be kept properly moistened by sprinkling; the cuttings must be of the growth of the last year; the cuttings thus draw nutrition from both ends, instead of drying up the end in the air." The above is well worth a trial, and may prove a valuable discovery if found practicable.

Surprise Valley.—The weather in Surprise Valley during the winter has been favorable for cattle, as we learn from a correspondent. Almost all of the emigrants have brought in an immense number of cattle and stock. A company is being raised for the purpose of settling Goose Lake Valley this summer, which will no doubt succeed if the Indians are not too troublesome. Farms in Surprise Valley are selling for two and three thousand dollars each.

Reese River Lumber.—The Mount Hope Company are rapidly exploding the idea heretofore entertained by this community that Lander county could produce no valuable timber. We saw at the company's yard a large number of boards twenty inches wide by twenty feet long and of splendid quality. Mr. Hendrie informs us they have large quantities of this timber near their mill, which is situated about forty miles west of Austin.—*Reese River Reveille.*

Machinists and Foundries.

PALMER, KNOX & CO.,

Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,

SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

First St., between Howard and Folsom Streets,

SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,

Machinery, Mining Pumps, Amalgamators,

Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.

*** Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, FREE OF COST.

All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,

Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequaled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR

MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;

HOPE'S AMALGAMATOR AND SEPARATOR;

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL;

JONVAL'S IMPROVED WATER WHEEL;

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pullies, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Railing, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

UNASSESSABLE.

First National

PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON,
W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured Six Hundred and Forty Acres of Land, in Tulare county, California, in the midst of one of the most valuable oil regions on the contiacnt. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ton or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "First National Petroleum Company," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

ATMOSPHERIC CONCUSSION ON EGGS.—We have heard it commented on by poultry-men that the concussion of the atmosphere occasioned by firing artillery in the immediate vicinity, is suspected of having the effect of addling eggs undergoing the process of incubation. Several persons who have had very fair success in hatching broods, find that the eggs which had been set before the salutes fired here on the 12th ult., have lost their vitality, and the nearly developed chickens were found in a putrifying state. Some of them had been under the hen for over thirty days. We understand that in the immediate vicinity of Vallejo, where firing of heavy artillery is common, eggs cannot be hatched. We have never heard such a theory broached before, but when it is considered what an effect the firing of cannon has on the atmosphere, and that in naval combats the destruction of myriads of fish has been occasioned, it is not improbable to suppose that the life of the unpipped chicken might be destroyed by a similar cause.—*Napa Reporter.*

THE Sunderland (England) *Times*, says: "Some beasts, pastured in a field near a rifle range in the country, are said to have died through swallowing *spent rifle bullets*. A cotemporary states that two and a half pounds of lead were taken out of one beast, and two pounds out of another."

THERE is a project on foot by several societies to build a Jewish Orphan asylum or hospital in San Francisco.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT.

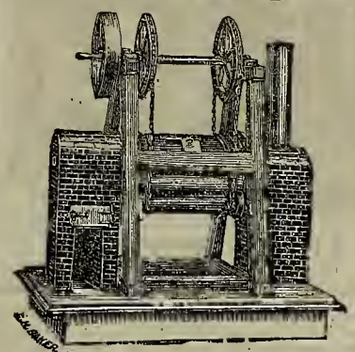
17v10 28 Second street, San Francisco.

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard



Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY, Engineer,**

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mulebback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA, WASHOE, ENGLAND, FRANCE,

—AND—

THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at Knstel Bros. works, Bryant St. between 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 8th, 865.] HEPBURN & PETERSON.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

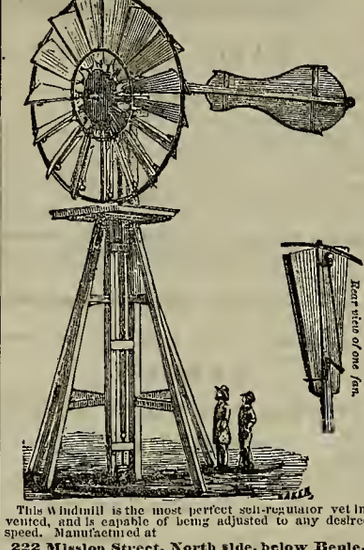
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, at the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$6.00.

Sent by mail, if desired. Address

DEWEY & CO.,

16v10-tf No 505 Clay street, San Francisco.

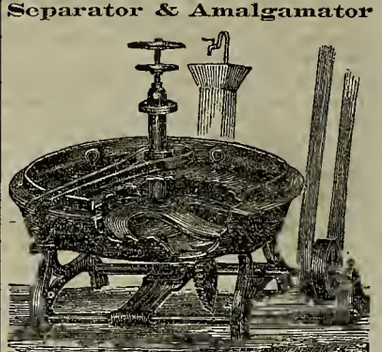
TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.



The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; it may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

AWARDED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, O. OOSTA, W. T. GARRATT, GEO. JOHNSON, H. P. WAKELEE, C. M. RANCIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this Amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay.....250	943	Assay 300		990
Assay.....285	941	Assay for Czotman		980
Assay.....286	940	Assay Water Rock		966
Assay.....291	950	Assay Water Rock		998
		.....St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

New Mining Advertisements.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meetiag of the Board of Trustees of said Company, held on the 29th day of April, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 21st day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN Q. ADAMS, Secretary.

Office, No. 6 Montgomery Block, San Francisco. my6

Daniel Webster Gold and Silver Mining Company, Sacramento District, Humboldt county, Nev.

NOTICE.—There are delinquent, upon the following described Stock, un account of Assessment levied on the 28th day of March, 1865, the several amounts set opposite the names of the respective Shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Smith, E F	210	25	$12 50
Smith, E F	211	25	12 50

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 20, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

THE income tax list of Nevada county Cal. shows that that county yields a larger individual revenue than any other in the State except San Francisco. Nevada is the quartz mining county of California. From that business the largest incomes are derived. The long and very respectable list is chiefly made up of those who made their fortunes by mining.

THE boilers and inachinery of a new steamboat, to be launched and run on Lake Tahoe, were shipped on the 1st inst., says the *Union*, for Lake Valley. They were built in San Francisco for H. Burke, the builder and owner of the boat. The steamer, which is not yet named, will be 113 feet long and 21 feet breadth of beam.

THE Jeffrey Oil Company filed its certificate of incorporation in the office of the County Clerk, in this city, on Tuesday last. The object of the Company is to bore for oil in the Mattole District. Capital stock, $100,000.

THERE is no joy so great as that which springs from a kind act or a pleasant deed, and you may feel it at night when you rest, and at morning when you rise, and through the day when about your daily work.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,
9v10-1m No. 4 Cedar street, New York.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LETCHER, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7v10-3m

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequaled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,
GOLDEN ERA BUILDING,
No. 543 Clay street, near Montgomery, San Francisco.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,

No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

Mining Notices—Continued.

Animas Silver Mining Company—Location of Mines: Ventanas, Durango, Mexico.

And in accordance with law, and an order of the Board of Trustees, made on the 10th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Saturday, the 6th day of May, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

EDWARD FLANAGAN, Secretary.

Office, No. 606 Montgomery street (up stairs), San Francisco. apr25

Cholla Copper Mining Company, McCourtney District, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of March, 1865, an assessment of $7.70 per share was levied upon the capital stock of said Company, payable on the 19th day of April, 1865, in United States gold and silver coin, to the Secretary, at his office, 611 Clay street, San Francisco, or to C. C. SMITH, Grass Valley.

Any stock upon which said assessment shall remain unpaid on Saturday, the 20th day of May, 1865, will be advertised on that as delinquent, and unless payment shall be made before, will be sold on Monday, the 5th day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, Room 8, No. 611 Clay street, San Francisco. apr22

Eureka Mill and Mining Company, Big Creek District, Lander county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of April, 1865, an assessment of fifty five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 17th day of June, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansomo street, San Francisco.

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, June 10th, 1865, and the sale thereof until Saturday, June 24th, 1865. By order of the Board of Trustees.

apr28 N. DUPERU, Secretary.

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 13th day of March, 1865, the amounts set opposite the names of the respective shareholders, as follows:

J F Lewis	132	90	45 00

And in accordance with law, and an order of the Board of Trustees, made on the 15th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the salesroom of J. Middleton & Son, 400 Montgomery street, San Francisco, on the 6th day of May, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, May 13th, 1865, at the same hour and place. By order of the Board of Trustees.

apr22 N. DUPERU, Secretary.

Blanks.—We furnish Secretaries gratuitously with correct blanks for advertising assessment notices, delinquent sale, postponements, etc.

Table Mountain Copper Mining Company, Stanislaus District, Calaveras county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 24th day of April, 1865, an assessment (No. 5) of one dollar per share, was levied upon the capital stock of said Company, payable immediately, in U. S. gold and silver coin, to the Secretary, or to J. M. PIKE, Superintendent, at Copperopolis.

Any stock upon which said assessment shall remain unpaid on Saturday, the 27th day of May, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 12th day of June, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

W. M. HUNTOON, Secretary.

Office, No. 436 Jackson street, San Francisco. apr29

Virginia and Summit Lake Water Co.

NOTICE.—There are delinquent, upon the following described stock, on account of assessment levied on the 28th day of March, 1865, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C W Langdon	not issued	700	$1400 00
Wm Muldrow	not issued	763	1500 00

And in accordance with law, and an order of the Board of Trustees, made on the 28th day of March, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on the 13th day of May, 1865, at the hour of 11 o'clock A. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. PHELPS, Secretary.

Office, No. 273 Clary street, San Francisco. Office hours, from 10 A. M. to 12 M. apr29

Wide West Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 18th day of March, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 18th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of Edwards, Olney & Co., No. 626 Montgomery street, San Francisco on the 6th day of May, 1865, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. S. BROWN, Secretary,

Per J. WARREN CLARK, Deputy.

Office, 430 Montgomery street, San Francisco. apr22

POSTPONEMENT.—The above sale is hereby postponed until Monday, May 15th, 1865, at the same hour and place. By order of the Board of Trustees.

J. S. BROWN, Secretary.

apr29 J. WARREN CLARK, Deputy.

Let it be Known.—When any of our readers respond (by letters of inquiry or by the purchase of articles) to advertisements found in our columns, they will confer a favor, not only upon us, but upon the advertiser, by mentioning the fact of having seen the notice in our paper

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent, including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Jose, California.

San Francisco, April 27, 1865. 17q10

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, at 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

Mining Summary.

CALIFORNIA.

Mining operations in California are progressing quite favorably, and with much vigor. New and frequent discoveries in quartz are daily reported, and a great number of new mills are now in process of construction, and many old ones undergoing important enlargements. The recent rise in the rivers, occasioned by the rapid melting of snows on the mountains, has interfered somewhat with work along their banks, but the same cause has given increased impetus to hill and hydraulic mining. The miners are rejoicing with the farmers in the confident hope of a season of unusual prosperity.

Shasta.—According to the *Courier*, the Washington Quartz Company, of French Gulch, have just cleaned up after a run of twenty days with ten stamps. This mill has been laying idle for some time, because of the want of machinery for saving the gold. Steps had been taken to procure the improved amalgamating pans, but in the meantime the quartz was accumulating at the mill. Finally, having made the necessary arrangements for saving the tailings, they commenced a run of twenty days, resulting in a mass of retorted gold weighing 463 61-100 ounces, which, estimated at $16 per ounce, amounts to $7,408. An assay of the tailings has been made, proving them to be worth $225 per ton.

The Baxter Company have made arrangements to have 300 tons of rock crushed at Kelly's mill, without expense to the company.

At a recent sale of the Kellenger Company's stock, Sneath & Boardman, of Red Bluff, purchased 339 feet at the rate of $11 per foot.

Roasting Furnace.—The *Courier* hears a a rumor from Copper City that Kelly purposes the erection of a roasting furnace at his mill.

Nevada.—The *Transcript* has seen some splendid specimens from the Mohawk lead, owned by Tisdale & Kidd, and situated on Gold Flat. They have some eight tons of rock on the ground and are about to commence crushing. The same paper says that the Sneath & Clay Company, which has been idle for some time, is about to start work again, and will put on a sufficient force to keep their mill constantly running.

The *Gazette* says that the Pennsylvania Company, whose mine and mill are located between Coyoteville and the Sugar Loaf, cleaned up, on Saturday last, $4,000 from their pans. This was in addition to what was taken from the coppers during the run—some twenty or thirty ounces per day.

A considerable excitement has grown out of a supposed rich quartz discovery on Willow Flat.

The Blue Gravel Hydraulic Mining Company, near Smartsville, cleaned up, on the 5th, about forty boxes of the head of their flume, after thirty days' run, taking out $26,809.

Plumas.—The Quincy *Union*, of April 22d, says that the McClellan lode is producing some of the finest ore yet discovered in it, paying as high as $500 per ton; the company will realize over $10,000 for the present week's work of their mill. What quartz mill of the same size in this State can beat that?

Siskiyou.—The Yreka *Union* says that one thousand one hundred and seventy-three dollars were taken out of the Oak Grove claim on McAdam's creek, last week.

Tehama.—The result of fifty tons of rock last crushed from the Williams & Killinger yielded $30 to the ton, five dollars per ton more than the first lot. The *Independent* says there is now but little of the stock of this company in the market. The last private sales heard of were at $30 and $35 per foot. This looks like a pretty good thing, and if the company succeed in making use of the fine waterpower they own, by the erection of a mill, there is a fortune for every stockholder.

Sierra.—The *Mountain Messenger* says: We hear that water has been plenty for several days past, and mining operations are being vigorously prosecuted in all the hydraulic diggings.

We are informed that the American Hydraulic Company at Morristowa, took out, after six days' run, sixty pounds of amalgam, which will yield nearly $9,000.

The American Hill Company recently cleaned up $5.100 after a six weeks' run. Their ledge is twelve feet wide. A one-sixth claim in this company recently changed hands for $5,500. Messrs. Kellogg & Cutter of Alleghany being the lucky purchasers.

Work is being prosecuted on the Morning Star with a view to building a mill upon the claim the coming summer. Gold is revenled to the eye daily as work progresses. The prospects are flattering. There will be great interest manifested in quartz here as soon as summer gives a chance for more active operations. Sluice mining is at a stand-still in consequence of a scarcity of water, but the miners are busy with preparations.

The American hydraulic company, at Morristown, recently took out, after six days run, sixty pounds of amalgam, which will yield nearly $9,000. To make this, the boys only used four pipes, but intend putting on two more soon. The mining camps in that vicinity are now plentifully supplied with water, and easier times may be looked for.

Butte.—A ledge was recently discovered about three miles from Oroville, from which five tons of rock was taken to Smith's mill at Long Bar, where it yielded $30 to the ton.

Placer,—The Folsom *Telegraph* is informed that the owners of the Layne silver claim, a few miles from Folsom, in Placer county, are making arrangements for the erection of a mill at a convenient point on the American river for the purpose of working the rock taken from their claim. Sometime since they erected works for the purpose of testing the rock at the claim, and the result is such that they intend at once to put up a large mill. The shaft is down about eighty feet. The ledge is increasing in width, and the rock is growing richer. We would not be surprised, says the *Telegraph*, to hear the music of four or five quartz mills in this vicinity in less than a year from this time.

Calaveras. — The indications now are that a large amount of work will be done in the mines of Copperopolis and vicinity the present year. Many companies are preparing to resume operations, and lively times may be expected the coming summer.

The *Courier* says that the Keystone Company have commenced drifting on the lead in their middle shaft, at a depth of about ninety feet, and are, we are informed, taking out a fine quality of ore. The men engaged on the lead in the shaft under the whim house, are extracting splendid ore. A large quantity is taken out daily. The company have already shipped this season about 120 tons; and would have forwarded more had the means of transportation been at hand.

The owners of the Union mine are now shipping from forty to fifty tons of first-class ore per day—all that can be sent away at present, owing to the scarcity of teams.

The Table Mountain Company commenced work again on Monday last, which had been suspended during the winter, on account of the impossibility of freighting ore to Stockton. Sixteen tons of ore have already been started for San Francisco.

Rich rock has lately been found in a quartz claim near Murphy's.

The *Chronicle* says that Messrs. Frontier, Deviercy & Co., a French firm of this city, are now putting up a fifteen-stamp mill within half a mile of Rich Gulch Flat, towards the Mokelumne river. The mill will be ready for crushing about the 1st of June. A new mill will be put up on the old Foote & Thompson lead, on the Mokelumne river, about one mile below Rich Gulch. Messrs. Gleason, O'Neil & Co. have been drifting out the old lead for several months, and have struck quartz that will pay them well for working.

Struck it Rich.—The San Andreas *Register* of April 29th says the Rathgib Brothers, proprietors of a ten-stamp quartz mill near that place, have struck a vein of decomposed quartz, which is exceedingly rich in gold. The *Register* thinks they have one of the richest leads in that section of the county.

Another lot of copper ore from the La Victoire Copper mine, numbering 736 sacks, was taken to San Francisco on Monday last by the steamer Cornelia.

WASHOE.

Three or four new mills are to be erected in Churchill county, at La Plata and Clan Alpine, the coming season. Several of the leads in those "new diggings" have been satisfactorily tested by mill process, and found to yield excellent results, enough to warrant the free investment of capital. During the two days prior to May 5th, $69,000 in silver bullion were shipped from Gold Hill; but it is said there will be less than the usual amount of bullion shipped from this point for some weeks to come, for the reason that several of the principal companies are engaged in sinking upon their claims for the purpose of opening new levels.

The Bob Apple mine, which has just been opened, is turning out some good ore. About sixty tons, sent to Harrington & Beach's mill, back of Carson City, yielded the handsome sum of $4,068.29, an average of $67.50 per ton. This ore was taken from the upper level of the mine, which is only 330 feet from the surface. It is said there is any quantity of this class of rock in that level.

The Parke Brothers have purchased the Granite Mill in lower Gold Hill, and have commenced overhauling the machinery. It will be in good running order in a short time. The gentlemen now owning the Granite are practical machinists, have superintended, built and run a large number of quartz mills in Nevada, and will doubtless make the mill one of the best in the State of its capacity.

A vein of good looking ore has been struck in the tunnel of the Daniel Webster claim, Red Mountain District, which has just got into the ledge, but not through it, therefore the width of it is not known. According to the *News*, the assays of this ore are highly favorable.

The Imperial has struck a body of very rich ore in their 520 feet level, carrying a large amount of black sulphurets.

Mr. Luckhart, the new superintendent, has taken hold of the Justis. They have lately cut into a very fine streak of ore, and will be able to take out and send to the mills from twenty to thirty tons of ore per day.

The *Union* of the 6th inst. says that Messrs. Carpenter, Hughes, Cole, Phillips, and some half a dozen others, started on that day for Red Mountain District, some 200 miles southeast of Virginia, and about 100 miles beyond Aurora. They went with an ox team and a mule team, taking along a boiler and engine of eight-horse power, and all the material for a mill of three stamps of 500 pounds each. The party is composed of practical millmen, machinists and miners, and therefore know exactly what they have undertaken to do.

ESMERALDA.

A correspondent of the Aurora *Union*, writing from Bliad Springs, Mono county, April 20th, says:

At Montgomery both the arrastras of Munckton and Hancock and the smelting furnace of Sol. Carter are busy. I am satisfied that the former have at last discovered the proper process of working our rock. From the Dana, located in the newly discovered section, 275 pounds yielded $31.30, or $250 per ton, and this was from the top; from one ton of the Scorpion twenty-three pounds of bullion was taken, which it is presumed will yield at the rate of $240 to the ton; from the rock brought in from Silver Peak District 1,200 pounds was crushed, yielding at the rate of $400 to the ton; and from the Maid 300 pounds yielded $64.94. In Carter's smelting furnace 1,200 pounds of the June and Washington Irving have been worked and a large quantity of metal run off, in which the silver can very plainly be seen with the naked eye, but the amount is not yet known.

SILVER MOUNTAIN.

The mines in Silver Mountain are beginning to wear a most excellent appearance, and a large amount of work is being done this season. The Washington, I. X. L., and various other claims are being worked, and considerable ore is already earthed ready for crushing at the Pioneer mill, so soon as a road can be built and the ore transported. More is now being done there, according to the *Chronicle*, than at any previous time. The I. X. L. has about 100 tons of ore ready for shipment to mill. Mr. J. C. Ransom, of Marysville, has been appointed superintendent of the Morning Star claim, and will soon commence sinking a shaft in the tunnel, which is now in over 800 feet.

REESE RIVER.

The mines of Reese River are becoming more prolific in their yield of precious metals. Hardly a day passes that Wells, Fargo & Co. do not forward to California from $1,000 to $8,000 in silver bars, the product of the Lander mines; and besides, the Fast Freight Company are bringing frequent invoices of the delightful article.

Successful Mill Work.—There was recently assayed, at the assay office of David Lundbom, says the *Reveille*, a bar of silver weighing 964.12 ounces, and worth $1,246.51, it having the remarkable fineness of 1,000, being perfectly pure as it came from the mill. The ore was from the mine of the Whitlatch Yaakee Blade Gold and Silver Mining Company, and was worked at the Midas mill, by the roasting and barrel process. So large a bar, and of such great fineness, speaks well for the purity of the ore, and also for the process and management of the mill.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction--A General Review---No. X.

BY PROF. L. LANSZWEERT.

METALLIC OXYDS.

I have already said, in my foregoing notes, that these are among the most numerous and the most important of metallic ores. The smelting of them depends on the application of the best practical means of removing oxygen. The relation of metals to oxygen, and the relative facility wherewith they evolve oxygen, wholly or partially, have been accurately determined by the chemist. On a large scale the exact agents employed in the laboratory for effecting desulpburization cannot always he applied; neverthcless, chemical principles have to be followed as closely as circumstances will permit; therefore it will now be proper to explain the relations of diffcrent metals to oxygen in respect of the comparative difficulty of removing that elemeut from them.

The reduction of metallic oxyds may be effected by the dry and the moist processes. It is the former, however, which immediately concerns the metallurgist, and to which I propose to direct the attention of the reader. The noble metals, gold, silver and platinum, are characterized, as is well known, by the difficulty wherewith their respective combination with oxygen admits of being effected; conversely, the respective oxyds of these metals are characterized by facility of decomposition. The application of heat alone, without the contact of any extraneous body, suffices to liberate oxygen from the oxyd of the noble metals, and of course to evolve the metal.

All other metallic oxyds require the agency of a second body to effect their reduction, mere application of heat being insufficient; and a consideration of the deoxydizing materials at the disposal of the metallurgist and employed by him, opens a field of great utility and interest. The deoxydizing agent of greatest importance to the metallurgist is coal, in its several varieties, and the derivative materials yielded by its combustion.

When coal is burned in a furnace, the first product of combustion may be considered to be carbonic acid gas; but inasmuch as the latter is readily decomposed by permeating ignited pieces of solid carbon (coke), losing a portion of its oxygen, and becoming carbonic oxyd gas, we may say that the products of the combustion of coal are, firstly, carbonic acid; secondly, carbonic oxyd and carbonic acid, and lastly, carbonic oxyd alone. The latter, in combination with heat, is a most powerful deoxydizing agent. Were it not for the production in furnaces of carbonic oxyd gas; were it necessary that the solid carbou of the coke should be alone the deoxydizing body, then it would follow that every particle of the ore to he reduced must be brought into intimate contact with the reducing body; a process involving more care and trouble than are compatible with large metallurgic operations. The reducing agent being a gas, there is no longer a necessity for that intimate mixture of fuel and ore which would otherwise be necessary. Provided that the gaseous results of combustion are placed under circumstances of readily permeating the ore, the neccssities of practice are amply subserved. In many cases of reduction of the oxyds of lead, silver, tin and copper, the fuel is actually contained in a furnace by itself; the ore to be reduced being in another. There is a great diffcrence as to the amount of heat at which the reduction of different metallic oxyds can be effected. The iron require a strong red heat, whilst the oxyds of manganese, chromium, tin and zinc cannot lose their oxygeu until heated to whiteness.

Combinations of the metallic ores with oxygen take place in certain definite proportions, and so far as relates to most metals, in definite quantities. Arsenic forms, in all stages of oxydation, an acid which never melts with any other acid, or with highly oxydized metals; it being a requisite condition of fusibility, that one of the constituents in which the other is merely suspended, must be fusible. This chemical relation admits of a wide range; nor is the same substance in all its relations of the same character.

As a rule, it may be stated that the compounds of single equivalents of metal and ygen constitute a base or alkali, and that the addition of more oxygen destroys that property. The affinity of oxygen for metal is most difficult to be overcome at a state of oxydation half-way between the extremes. Protoxyd of tin is easily converted into metal; so is peroxyd; but the sesqui-oxyd, intermediate between the two, presents much greater difficulties. Practically it is usual to smelt with the highest oxyds and convert the ores into that state, in order, not only to remove the oxygen from the metal, but also to produce so high a heat as to fuse the metal at the precise moment when the oxygen is removed.

Hydrogen and carburetted hydrogen gases must be omitted in our enumeration of the deoxydizing agents employed by metallurgists. The latter agent, carburetted hydrogen, is evolved during the combustion of coal; the former, when employed, as it is, though sparingly, as a metallic agent, is developed by transmitting aqueous vapors over red hot coke. When this gas is produced by dissolving iron or zinc in a diluted acid, it is always moist, and invaluable for the performance of any delicate experiment; for the reduction of metallic oxyds it should be dry, and free from any foreign substance.

Carburetted hydrogen or coal gas is used to reduce oxyds under a low heat, the carbon which is precipitated in the formation of the metal being removed by smelting. Hydrogen or carburetted hydrogen is applied in the assaying process, by leading it into a glass tube which contains the ore specimen, in a proper form, already heated. A gentle current of gas is passed over the ore until no more is burned by it, which is manifested by the escape of the gas in a pure form.

Next to metallic oxyds, metallic sulphides are of the deepest importance to the metallurgist. Their reduction generally involves the operation of roasting, a process to be treated of bercafter.

[To be continued.]

Iron Architecture.—Ironwork requires a style of architecture to itself. It must have have its own style, otherwise it is very costly, or quite out of place. The finest piece or specimen of iron architecture I know of is the Amsterdam Crystal Palace, opened last year in Amsterdam. This is really a magnificent building, and is well worthy of a visit by those who are studying iron architecture. Mr. Outshoorn, the architect, has not ignored the great strength of iron compared with brick or stone, and has designed this building accordingly. The Winter Garden, now being erected in Dublin, is good in iron architecture, and will be very pleasing to the eye—especially to those who have seen our exhibition building in 1862.

Mr. Owen Jones is, in the opinion of many, the best iron architect. He has designed many beautiful iron constructions, and if he were consulted more frequently by engineers on the architectural appearance of their works, we should have much that would be greatly admired. Architecture is almost altogether ignored by many engineers; their great ambition is to cover large areas and long distances by one span, and then consider it a great work. Many of our railroad stations are covered with an immense roof of one span, with a complete failure as to ornamental appearance, but a perfect success as to a look of bigness. Many of these roofs might be constructed very much cheaper, and be perfect pictures in ornamental appearauce.—*Report of Society of Engineers.*

The Coal and Lignite Production of Austria.—Although we have good reason to believe that, with the exception of Spain and England perhaps, where mining operations were carried on by the Phœnicians, Austria is the first country in Europe where mines were worked, and the manufacture of iron was known; still it is only very recently that the coal and iron industry has begun to occupy a position more in accordance with that of the other German States. The Morcian steel was already celebrated in ancient times, but Austria has likewise extensive coal beds in all the crown lands, and amongst them Bohemia in this respect undoubtedly occupies the first place. The most important basin is situated on her western frontier, not far from the spot where the Moldau flows into the river Elbe, which till now, however, has been opened in the upper levels only. The following numbers will prove better than anything how considerable the increase of the coal and lignite productions have been during the last few years: In 1855 it was only 2,101,045 tons; while in 1862, 4,552,485 tons of coal and lignite were raised (in Prussia 16,895,000 tons). In 1863 the quantity has considerably increased, and it is a strange circumstance that at the same time, while Westphalian coals have been imported in large quantities, and even forwarded beyond the Elbe districts, the consumption of English and Bohemian coals in Austria has considerably decreased. The coal prices, on account of the high rate of carriage exacted by the railway companies, are still very high in Austria, and the importation of cheaper foreign coal, therefore, leaves no margin for profit.—*London Colliery Guardian; March* 18.

Crosby & Thompsons' Gold-Saving Process.

This is the result of experiments upon the sulphuret gold-bearing ores of Colorado, continued through nearly two years, and a close acquaintance with a great variety of methods used in different countries for working similar ores. These experiments were made in Colorado, upon ores taken from a great number of lodes, for the purpose of ascertaining their general constitution, their general quality, the best method for a perfect dry analysis, and the best mechanical application for their manipulation; adhering strictly to the conditions required by analysis. The general constitution of the ores was found to be the same—mainly sulphur and arsenic, combined with metals, iron, copper, lead, silver, gold, &c.; different lodes varying in proportion of the above, and some containing only a part. The general quality of the ores was found to be vastly better than could be inferred from the product obtained by the methods of working them then in use, varying from twenty to two thousand dollars per ton; in fact, we are convinced by the results of our tests, that the sulphurets of any lode in the Rocky Mountain gold field that shows gold in the outcrop or quartz, will yield gold in good paying quantities.

In determining the best method of manipulation for a dry analysis of the ores—we found that gold existed in them in two conditions—native metal and its sulphide, and that the proportion of sulphide to native metal increased as greater depths in mining were reached. This association of the gold with sulphur renders it volatile at a low degree of heat, creating the necessity of condensing the metallic vapors; and to liberate the fine gold absorbed or contained in the iron oxyds, a thorough grinding is needed, also, to fit the metal for amalgamation. The mechanical application is designed to meet all the requirements of a perfect combustion of the ores, a thorough condensation of vaporized metal, and a thorough grinding of the oxyds.

The construction consists of a furnace in which is placed two or three cylinders after the following manner:

A series of two cylinders would be arranged as follows:—

A series of three would he arranged thus:—

The one placed uppermost is employed as a drying cylinder, and discharges into the lower ones, which are used for burning, and are furnished with large hollow axles that are perforated so as to admit air at all points in its length. At the discharge end of these cylinders is placed a gas chamber to receive the gases, and a trap for the solids to fall through. This gas chamber opens directly into a condenser, so made that the condensed matter is discharged through a trap into a wooden grinder, that also receives the burned solids from the trap previously mentioned. The condenser connects directly with the center of a blower that discharges into the chimney of the furnace, creating a draft, so that a short stack only is needed. The material passes from the grinder, prepared in the best possible manner, to an amalgamator that is so constructed as to pass all the gold-bearing matter, in a finely divided state, through the body of the quicksilver, securing contact with its internal surfaces.

The manipulation consists in drenching the pulverized ore, after it has been received from the stamps on to the platform of the feeder, with a strong solution of common salt; it is then conveyed to the drying cylinder where it is dried and heated ready for burning, and discharged from that into the burning cylinders, (heated to about 1,000° F.,) where it is entirely desulphurized, the baser metals being oxydized, the gold, &c., made metal, and the sulphur converted into sulphurous acid. The solid products of the combustion are discharged at the bottom of the gas chamber, and conveyed by a carrying apparatus to the wooden grinders. The gaseous products are conveyed from the gas chamber into and through a condenser by the action of the blower, where all the condensable gases are condensed and discharged through a trap into the wooden grinders; these reduce the material to the finest kind of pulp, and from the elasticity of its grinding surfaces, are able to rub, polish or grind the finest particles, though coarse and hard material may be among them, fitting the material in the best possible manner for amalgamation; from the grinders the material is conveyed to the amalgamator.

Results obtained by the treatment of ores in this way are enormous; there is nothing lost of the precious metal that can he obtained by the best dry analysis. The plentiful supply of oxygen by the perforated hollow axle producing perfect desulphurization, the internal draft made by the blower preventing any escape of vapor, the thorough condensation of all metallic vapors by the condenser, and the presenting of the material thoroughly fitted to perfect amalgamation from the grinders, make this manipulation practically, as well as theoretically, a perfect analysis of pyritous ores in a large or working way.

The same ores that yield ordinarily from ten to twenty dollars per ton by the old methods of work, are made to yield from forty to two hundred dollars per ton, or about ninety per cent. of a good wet assay.

One of the machines of this construction is now at work at the Excelsior Mining Company's mill, at South Boulder, in Colorado, proving by its tremendous results, its capacity and efficiency to be fully equal to the most sanguine expectations of its inventors. Each machine has a capacity equal to the manipulation of ten tons of ore in twenty-four hours. Any man of ordinary intelligence can manage one after a little explanation, and not be bothered with the custody of a tremendous "secret." Actual results are the only tests that the inventors wish for themselves or any purchaser to rely upon; they being fully conversant with the working of machinery at the mines, introduced with great parade, and the expectations of the mining world raised to the highest key, only to be succeeded by despondency after a little experience had proved their inefficiency, will not urge the adoption of their method by any company, miners or millmen, until they shall be satisfied by the actual result of regular work. Neither will they seek to obtain fabulous royalties, but fair rates, and satisfaction to the right purchasers, will be made the basis of their sales.

It is no difficult matter to chemically analyze an ore, and test for scientific purposes the ingredients, and specify the exact amount of gold there.

So, in a small way, are many processes offered which save the gold in a hand experiment, but when attempted in a large and practical way are all utter failures.

This process was perfected on the spot and in a large way, and is offered as a thing that does it—not based on a handful or a few pounds of ore, but by the ton, or cord, as miners contemplate when in the process of mining.

It is observed in the assay of ores, as developed by Colorado mining, that, as a rule, they increase in richness as they sink in depth; and also as they in this way increase in richness by assay, the combination yields with more difficulty to manipulation—that is, while the assay shows relatively more gold, the practical working under the same manipulation often, or generally, shows less; and the inference is, (and sufficiently proved to assert it) that the tailings are richer, that is, more of the gold remains unreached by the usual mode of working, and hence the value of any process that meets the difficulty.

This "process" assumes (and the assertion is demonstrated by the result and phenomena presented in the development of this process) that the gold in the ore is an imponderable or in a vaporized form; that it aggregates or condenses (the latter term we like better, though in conflict with the records of chemical science) at a low temperature; that in its normal condition in the ore the gold is not in a metallic form. At any rate, acting on this principle all the gold is obtained.

It is known that it takes 2500° to melt gold; the operation in the "Crosby" process is performed at less than 1000°, say about 800°.

It is known as a fact that the pyrites containing the gold as it comes out of the mine, or crushed to a fine powder, shows no visible gold, not even by microscopic inspection. We are aware that a piece of ore in the streak of the vein in some of the lodes, supposed to be the result of fire, there may be specimens which conflict with this statement; so, also are specimens frequent in the blossom and elsewhere, where bits of segregated gold can be seen and picked out. Such cases are the result of oxydization, or chemical or igneous action, and really no more conflict with this statement than a retorted lump does—it is the result of action, and is not primordial. We still say, the ore—by which we mean the ore as it is found in its natural condition, be it large or small—shows no gold to sight, (however rich in character) aided by the microscope. This is not enough to prove its volatile character, but, with other proof, it favors the theory we advance.

We propose to make some extended remarks upon the process and claims of Messrs. Crosby & Thompson in our next issue.

In Luck.—Some time last Fall, Mr. A. Cummings, the owner of one of the mining claims on Dutch Hill, started on a trip to Salt Lake City, leaving his claim in the charge of his partner. Mr. C. returned home a few days since, and was agreeably surprised when his partner brought out purses containing over one hundred ounces of dust, and presented it to him, that amount being his share of the net proceeds taken from the claim during his absence.— *Quincy (Plumas Co.) Union.*

Mechanical.

New Invention.—It was our privilege, a few days since, in company with a number of citizens of Downieville, to examine a model of a new style of track for railway cars; the invention and workmanship of our venerable friend, Abraham Gregg, Esq., of Forest City. This invention is intended to be principally used on horse railroads, its object being to avoid the friction and consequent wear of wheels and track in passing curves. Of course on every curve there is a difference in the length of the two rails; and where the axles are rigidly fastened to the car so that they can always remain parallel to each other, there must necessarily be a dragging of the wheels on the outer side in passing a curve. Mr. G.'s model is so arranged that each axle can at all times maintain a right angle to the line of track; while the axles are so constructed that either wheel on the axle can move independently of the other. By these means the car is enabled to move on a curve with no more friction than on a straight line. We noticed that a power of one and a half pounds would pull the model, which was loaded, around the curve, whereas, when the axles were fastened in the ordinary rigid position, a power of six and a half pounds was required. If the wheels had revolved with the same motion still a greater difference would have been apparent. Mr. G. has also made a very ingenious application of a brake, in such a way as to completely avoid the wear upon the wheels by the frequent stoppage.—*Mountain Messenger.*

Flow of Solid Bodies Submitted to Strong Pressure.—A very interesting paper was recently read before the French Academy, by M. Tresca. The subject was the "Flow of solid bodies submitted to strong pressure." It will be in the memory of those interested in the physical history of the earth that the celebrated theory of the movement of glaciers which was put forward some years since by Forbes, was based upon the supposition that in glaciers the particles of ice are not so firmly bound together as is generally believed, but that they have the power of flowing over each other. On this hypothesis he regarded the motion of an icy sea not as simply the sliding of the entire mass through the valley, but as the movement of a great mass of particles which have not only traveled over the land beneath, but over each other also. In fact, that a glacier was a very slow flowing river, in which, as in a stream of water, the particles next the bank flowed less rapidly than those lying in the center. It seemed hard to conceive that a substance whose particles possess such an intense power of cohesion as those of ice could be capable of flowing in the manner indicated; but the researches of M. Tresca show that even in metals the same phenomena appear. The results of numerous experiments showed him that, without undergoing any alteration of state, solid bodies flow from an orifice in exactly the same manner as liquids, when sufficient pressure is applied to them. The soft metals were those employed in his experiment, and from his numerous observations, he has arrived at the generalization that there is a unity of constitution in all matter, and that masses of the most solid metals are formed of separate and molebile molecules.

Reviven Corks.—The attention of the public has been called by M. Stanislaus Martin to the employment of refuse corks as dangerous to public health. It is the custom of the Paris scavengers to collect those which are brought down by the sewers, and sell them to persons who make it their business to revive them. If the corks are of unsightly shapes they are rent; while, if containing holes, they are filled up with mastic, and then smeared with powder to give them a proper color. Such corks used only to be employed by the ink and blacking makers, but their low price (5s. 6d. per 1,000) has of late induced retailers of bottled beverage to purchase them. Some of these corks may have been formerly used to stop bottles containing poisonous substances; for although a good cork is not permeable, a bad one, full of holes, may readily become the receptacle of particles of verdigris, carbonate of lead, arsenic, or an infinity of other poisonous substances, which may be more or less soluble in water, wine, beer, cider, vinegar, milk, or oil.—*London Grocer.*

Purifying Water.—A correspondent of the *Druggists' Circular*, writes that paper, as follows:—Having occasion to purify river water which was colored by passing through swamps containing muck, peat, and other decayed vegetable matter, I tried the usual method with alum, which deposited the mechanical impurities but left the water the color of pale sherry wine. I then mixed 1 oz. powdered alum and 2 oz. clean white clay together, for one barrel of water, made a thin paste and stirred it with the water, which in twelve hours was perfectly transparent and colorless. The precipitate in the latter case was of a dark chocolate, in the former a pale ashen color.

Utilizing Refuse Tinned Iron.—Some improvements in treating and utilizing refuse tinned iron and other combined metals has been provisionally specified by Mr. N. O. Andre, of Paris. He proposes to subject the cuttings to the action of nitrous or nitric vapors or any other gaseous acids, with a view to the re-employment of the metals, especially tin, such scraps forming the refuse of various existing manufactures or products. The metal refuse is first poured into a vertical column from five to ten yards in hight, and of a size proportionate to the amount of products to be treated. This column is divided into compartments of about fifteen inches in depth by means of wood divisions moving in a horizontal plane. The metal is put in at the top of the column, care being taken to introduce the wood divisions above each compartment when filled, so that the total weight of the metal shall not rest on the bottom, but be divided into as many fractional parts as there are compartments. The acid vapors are then introduced at the lower part of the column (nitrous vapors for example), and so the other hand steam is introduced at the same point, which, becoming partially condensed, renders humid the substances contained in the column. The gaseous acids oxydise the surfaces of the refuse metal, and ultimately attack the iron, and this action is allowed to continue in order to insure the oxydation of all the foreign metals; and when the operation has sufficiently advanced, the bottom compartment of the chamber is emptied, and the divisions above mentioned successively withdrawn from the bottom upwards, so as to empty the contents of each compartment into the next below it which has become vacant, while the upper one is charged with a fresh quantity of materials. The refuse, which is now covered with a pasty oxyd, is washed in several waters and sorted, while if there be any oxyds still adhering it is again washed in acidulated water and then rinsed. The sorting is effected with greater or less care according to the purpose for which these clean iron scraps are intended. The acids are reduced and melted in a crucible enveloped in charcoal in the ordinary manner. In order to obtain the tin in a perfectly pure state the oxyd is washed in nitric and acetic acids. If the metal scraps have been treated by means of the vapors of hydrochloric acid with a view to obtain the whole or part of the tin in the state of protochloride it may be precipitated in a metallic state by means of zinc. The iron scraps or solder which may have been imperfectly deprived of tin or other metal are introduced a second time into the column, or they may be employed in chemical operations where the presence of small quantities of lead or tin is not prejudicial.

A Valuable Invention.—Captain D. C. Mitchell, of this city, has received the patent right, for the Pacific States, of one of the most useful inventions of the day, the inventor being his brother, Henry Mitchell, of Richmond, Indiana. The invention consists of a combined faucet and mensures, so arranged that the liquid contents of any cask or other vessel can be drawn and accurately measured without the use of measures or funnels other than such as are embraced in the faucet itself. While it obviates altogether the use of measures it operates much more perfectly than the old method of drawing and measuring such liquids as have a tendency to loam up when drawn, as coal oil, linseed oil, etc. The cut which we have before us represents a large faucet with a graduated funnel, having pint, quart, half and one gallon marks thereon, and having a hole in it to correspond with the hole of the faucet. In drawing any liquid, the funnel is turned so that the hole comes opposite the faucet, and after the required quantity is drawn, the funnel is turned half round and its contents emptied into a receiving vessel. The funnel or measure has a close fitting top to keep out flies, dirt, etc. The inventor has disposed of his right to five of the Western States for a handsome sum, and is erecting an extensive manufactory at Dayton, Ohio, for supplying the balance of the Union. So soon as the Captain receives his model he will make arrangements for their manufacture in San Francisco, and appoint agencies for their sale. We congratulate him upon his success in getting the world by the right place.—*Markleeville (Alpine Co.) Chronicle.*

Mr. James B. Nelson, the inventor of the hot blast, died in Scotland recently. Being engaged in the gas works, his attention was directed to the smelting of iron, and he satisfied himself that a vastly increased and improved effect of the forced blast could be attained by heating the air in its passage from the blower to the furnace. The hot blast revolutionized the iron trade, and made railways possible in an economical sense. In 1828, when it was introduced, the produce of the Scotch smelting furnaces was 29,000 tuos a year, in 1864 it was 1,160,050 tuns; and the price was over £7 per tun in 1828, and in 1864 it was £2 18s. 3d. Probably the most of this increase and saving is due to the hot blast.

Gold and Silver Inks.—Gold ink is prepared as follows: Grind upon a porcelain slab with a muller, gold leaf and fine white honey, till the former is reduced to an impalpable powder. The paste is then collected and diffused through water, which dissolves the honey, causing the deposition of the gold; the water must now be decanted and the sediment edulcorated to free it from the saccharine matter. The powder, when dried, is very brilliant. When required for use it is suspended in mucilage of gum-arabic. After the writing with this ink is dry it should be burnished with ivory. Silver ink is prepared in the same manner, using silver instead of gold. A fine *purple ink* is said to be produced in the following way: To 12 pounds of Campeachy logwood, add as many gallons of boiling water; pour the infusion through a funnel with a strainer made of coarse flannel, on one pound of hydrate or acetate of copper—verdigris—finely powdered; at the bottom of the funnel a sponge is placed; then add immediately 14 pounds of alum, and for each 17 gallons of liquid, add 4 pounds of gum-arabic or senegal; let these remain for 3 or 4 days, and a beautiful purple will be the result.

Zinc White.—We have tested a sample of zinc white just made by a new process, by a mining engineer connected with a company in Boston. It is a pure white and has more body or opacity than any zinc white we have previously seen; and it works well, and seems fully equal to the French silver white, or the krems white. It is made in the process of redneing ore, and is in fact a utilization of a product hitherto wasted. Such economies, which are practicable only to companies that have great capital, and are able to employ many men of scientific attainments, are needed to render the products of mining cheap to the public and remunerative to the producers; and it is a good sign of the times that vast capital, not merely in paper, but in money, is being invested in what may be called comprehensive and economical mining operations. When business is conducted in this way, and competent men are employed in all the departments, the abundant natural resources of the country will reward those who thus engage in developing them; and there will be no occasion for the "protection" needed by concerns that have little capital and less talent.—*American Artisan, March 29.*

Artificial Marble.—We have heard of a process for producing artificial marble. Geologists tell us that one sort of real marble is nothing but chalk, through which an intensely-heated stream of carbonic acid has passed. The new process consists in heating powdered limestone and chalk in a porcelain vessel, from which atmospheric air is excluded. This seems simple enough; but whether it can be economically applied on the great scale, remains for further experiment. A method of couting wood with a varnish as hard as stone has been recently introduced in Germany; the ingredients are forty parts of chalk, forty of rosin, four of linseed oil, to be melted together in an iron pot. One part of native oxyd of copper, and one of sulphuric acid, are then to be added, after which the composition is ready for use. It is applied hot to the wood with a brush, in the same way as paint, and, as before observed, becomes exceedingly hard on drying.—*N. Y. Mining and Gas Light Journal.*

Discoveries in Electro-Plating.—M. Well, a French chemist, announces a new method of depositing metals. The baths he employs consist of metallic salts or oxyds in alkaline solutions by means of tartaric acid, glycerine, albumen, or other substances, which prevent the precipitation of the oxyd by the fixed alkali, in some cases with, and in others without, the aid of zinc or lead, and at various temperatures, according to circumstances. He claims, also, to be able, by like means, to give variety of color to articles covered with copper by his process. M. Well says that the most important application of his discovery is the deposit of copper and the bronzing of iron (cast as well as wrought) and steel without the preparatory dressings with conducting substances, which are necessary in proceeding according to the ordinary methods before the object is placed in the bath and submitted to galvanic action. This, if it bear the test of practice, is a very important fact. Iron and steel thus coated with copper may, says M. Well, be afterwards silvered or nickelized by his process.

Hay Press.—The Napa *Register* says that Wm. Mock, of Vallejo, has invented a new hay-press by which hay is pressed into sheets between rollers and then baled as fast as can be corded up.

The bones of a huge antediluvian animal have been excavated by the miners at Murphys, says the San Andreas *Register*, the knee joint of which weighs fifty-six pounds. The other bones are in the same proportion and shows that a very large species of animals—larger than any which are now known—once existed in this country.

Why Scalded Meal is more Nutritious than Raw.

The nutriment afforded to animals by seeds and roots, depends upon the rupture of all the globules which constitute their meal or flour. These globules vary in different roots, tubers and seeds. Those of potato starch, for instance, are usually from fifteen ten-thousandths to the four thousands part of an inch; those of wheat rarely exceed the two-thousandth part of an inch, and so on. From experiments made on these globules by M. Rapsail, the author of "Organic Chemistry," and M. Biot, of the French Academy of Science, the following conclusions have been drawn:

1. That the globules constituting meal, flour and starch, whether contained in grain or roots, are incapable of affording any nourishment as animal food until they are broken.

2. That no mechanical method of breaking or grinding is more than partially efficient.

3. That the most efficient means of breaking the globules is by heat, by fermentation, or by the chemical agency of acids or alkalies.

4. That the dextrine, which is the kernel, as it were, of each globule, is alone soluble, and therefore alone nutritive.

5. That the shells of the globules, when reduced to fragments by mechanism or heat, are therefore not nutritive.

6. That though the fragments of these shells are not nutritive, they are indispensable to digestion, either from their distending the stomach, or from some other cause not understood; it having been found by experiment that concentrated nourishment, such as sugar or essence of beef, cannot sustain life, without some mixture of coarser or less nutritive food.

7. That the economical preparation of all food containing globules or feeula, consists in perfectly breaking the shells, and rendering the dextrine contained in them soluble and digestible, while the fragments of the shells are at the same time rendered more bulky, so as more readily to fill the stomach.

The New England Sabbath.—The Puritan Sabbath had great and obvious evils. Its wearisome restraints and over-strictness cast a gloom on religion, and arrayed against the day itself prejudices that now are underminiog it and threatening its extinction. But it had great merits and virtues, and produced effects on society that we cannot well afford to dispense with. The clearing of a whole day from all possibilities of labor and amusement necessarily produced a grave and thoughtful people; and a democratic republic can be carried on by no other. In lands which have Sabbaths of mere amusement, mere gala days, republics rise and fall as fast as children's card houses; and the reason is, they are built by those whose political and religious education has been childish. The common people of Europe have been sedulously nursed on amusements by the reigning powers, to keep them from meddling with serious matters; their religion has been sensuous and sentimental, and their Sabbaths thoughtless holidays. The common people of New England are educated to think, to reason and examine all questions of politics and religion for themselves; and one deeply thoughtful day every week baptises and strengthens the reflective faculties; the Sunday schools of Paris are whirligigs where young France rides round and round on little hobby-horses till his brain spins even faster than nature made it spin; and when he grows up his political experiments are as whirligig as his Sunday education. If I were to choose between the Sabbath of France and the old Puritan Sabbath, I should hold up both hands for the latter, with all its objectionable features.—*Mrs. Stowe's House and Home Papers.*

Ladies Should Read Newspapers.—It is a great mistake, in female education, to keep a young lady's time and attention devoted to only fashionable literature of the day. If you would qualify her for conversation, you must give her something to talk about—give her education with this actual world and its transpiring events. Urge her to read the newspapers, and become familiar with the present character and improvement of our race. History is of some importance, but the past world is dead, and we have nothing to do with it. Our thoughts and our concerns should be for the present world; to know what it is, and improve the condition of it. Let her have an intelligent opinion, and be able to sustain an intelligent conversation concerning the mental, moral, political and religious improvement of our times. Let the gilded annals and poems on the center table be kept a part of the time with weekly journals. Let the whole family—men, women and children—read the newspapers.—*Godey.*

Mining Incorporation.—The certificate of incorporation of the Batopilas Mining Company has been filed in the office of the Clerk of the County Court. The mine of the Company, from which they derive the name, is situated in Chihuahua, Mexico. The capital stock is $540,000. Trustees: B. F. Lowe, Charles Dusenberg, Tetford McCann, Arthur Ebbetts, and Samuel M. Farran.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, May 13, 1865.

Applications for accommodation in Bank have been rather more numerous this week, but the money market shows no stringency. Capital available for loan purposes is abundant, and parties in good credit and others with acceptable collateral find no difficulty in obtaining the usual facilities in Bank at 1½ ₱ cent. per month. Mining stocks are regarded with less favor, and a number of loans upon this description of security have been called in during the week. In some instances those who were unable to respond promptly, have been forced to sell their stocks at the best rates the market afforded and serious losses were sustained.

Receipts of treasure since the 1st inst. from the interior have amounted to $2,000,000, and the bullion product of California and Nevada for the current month will probably exceed that of last month. Gold bars have been taken to account by the bankers at about 830 and silver was sold at 2 ₱ cent. discount to 1 ₱ cent. premium—the latter figure for bars of average fineness.

Legal Tender Notes have attracted less attention than usual, and the recorded sales at the Board amounted to less than $200,000, receding from 72½c to 71½c, rallying to 75c, and closing at 75c bid, 74½ asked. Latest telegraphic advices from the East quote gold at about 132½, after having touched 128.

The mining share market presents a less cheerful view than at the close of last week, and nearly every stock on the list has been sold at a decline. The apprehension felt as to the future productiveness of a few prominent claims together with the unfavorable character of recent developments in others, seems to have shaken the faith of many dealers, and until confidence has been measurably restored it will be difficult to revive the speculative spirit of former periods. Some contend (and especially those who are in the *bear* interest) that an undue importance has hitherto been attached to a number of mines, and that their present appearance and yield do not warrant the high prices current a short time since; while others maintain that temporary causes are operating to depress their real value, which may at any moment disappear. The well-known theories of experts and others practically acquainted with certain mines in Nevada, are entitled to some consideration, and it is not at all reasonable to conclude that any portion of the Comstock lode, which has heretofore revealed the existence of a positive mine, will suddenly become valueless, or even approach the condition predicted by a certain class of croakers. Considerable stock has been sold for New York account this week, and a number of purchases were also made for Eastern parties.

Yellow Jacket has exhibited unusual activity and 321 feet were dealt in, advancing from $1,760 to $1,840, declining to $1,585, rallying to $1,700, receding to $1,420, seller 30, then advancing to $1,480, and closing at about $1,400. We are informed that the product of the mine, thus far the current month, equals that of a like period in April, but that no improvement has taken place in any portion of the claim. The Morgan mill is now the property of this company and is crushing some 50 tons of ore per day. Improvements are in progress which will increase its reduction capacity 50 ₱ cent.

Gould & Curry has been less affected than some other leading shares, and 86 feet have changed hands, advancing from $1,525 to $1,600, receding to $1,400, seller 30, rallying to $1,435, and selling yesterday at $1,400 and $1,360. There are no new developments in this mine. So far as can be ascertained at present, a reserve of probably 20,000 tons of ore remain untouched in the old works, and some stockholders appear to entertain no fears of a reduction of the dividends, for some months hence, at least. Drifting continues from the D street shaft, and receipts of bullion are up to the usual average.

Savage has been subjected to a severe pressure by short sellers and others anxious to realize, and large transactions were made; opening at $1,700, declining to $1,500, seller 30, rallying to $1 600, buyer 30, receding to $1,350, seller 30, rising to $1,400, and closing at $1,275. Within this range 129 feet were sold. Advices are somewhat conflicting as to the real condition of this mine, but recent developments are doubtless less flattering than for some time past, and there is some talk of a $50 dividend for the month of May. Considerable hypothecated stock has been sold the past few days, and it is proper to state that a formidable bear party have taken advantage of this and other circumstances, with a view to fill their seller's option contracts at still lower prices.

Belcher was exceedingly active at variable rates—and 132 feet changed hands—advancing from $1,000 to $1,200, declining to $1,020, again rallying to $1,200, then receding to $1,100, and closing at $1,120. The product of this claim for the month of April exceeded 2,700 tons, and on the 4th inst. a surplus of some $15,000 remained in the treasury of the company, which balance has since been increased. From December last to April 31st 9,347 tons of ore were taken from the second or 263-feet level, and during that period five dividends, amounting in all to $285, were disbursed to stockholders. During the past two months the third or 303-feet level has been opened, and various side drifts disclose small quantities of ore. From this depth a shaft is now under way (down 40 feet) for the purpose of opening two additional levels, 400 and 500 feet respectively, from the surface.

Crown Point rose from $1,025 to $1,073, receded to $960, seller 30, and closed at about $845; some 50 feet were sold. Receipts of bullion are increasing, and the work of development continues.

Alpha has met with no sales this week and is apparently held with some firmness at about $875.

Ophir is about the only exception to the decline in other stocks and has been in decided request, advancing from $380 to $635, declining to $500, and selling yesterday at $490. The late rise is attributable to recent discoveries in a portion of the mine claimed by the Burning Moscow Company. The suit of the latter *vs.* the Ophir Company has been postponed until July. The Mexican shaft is now down 540 feet, and the new pump will soon be in operation. A small quantity of ore is still taken from the north mine, and the company have a balance on hand over and above their liabilities.

Chollar steadily declined from $480 to $425, then rose to $475, fell to $390, rallied to $425, buyer 30, and sold yesterday at from $405 to $350. Within this range 329 feet have been dealt in. There is no change to note in the fifth station of the south mine, and no improvement has taken place in other portions. Preparations are now under way to open this claim from the lowest level in the Potosi mine. An assessment of $50 per foot was levied on the 8th inst. Potosi is also in less favor, declining from $550 to $390, and closing at about $375; within which range 267 feet were sold. Good ore, it is said, can be taken from the "Bajazet chimney," but other levels are not looking well. An assessment of $50 per foot was levied on the 8th inst.

Empire Mill & Mining Company is well maintained, and small sales were made at $490 per share. A dividend of $20 per share was paid on the 10th inst. Hale & Norcross fell from $425 to $400, rose to $440, and closed at $425 asked.

Minerva is comparatively steady, and small transactions have taken place at $300 and $275 per foot. A drift is now in progress from the main shaft, at a depth of some 400 feet.

Uncle Sam declined to $240, rose to $260, and closed at about $240. Overman was sold at $240.

Imperial is in much less favor, and small sales were made at from $298 to $210, closing at about $215 asked. Drifting still continues north and south on the east vein in the lower level.

Bacon (G. H.) is inactive, but firmly held at about $250 per share. The company are hoisting some 30 tons of ore per day through the Empire shaft, and employ no outside mills. A first dividend of $10 per share was declared on the 9th inst.

Bullion fell from $170 to $155, rallied to $165, and closed at $140. Nevada (J. G.) declined from $50 to $40, rose to $47½, closing at $45. Burning Moscow fell from $40 to $32, rose to $48½, and sold yesterday at $44. Wide West rose from $8 to $10, and fell to $9½.

The recorded sales of stocks and Legal Tender Notes since Saturday last amounted in the aggregate to $1,534,875.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associates in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of construing patents, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination, although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed with in its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will ofttimes find it very important to take advantage of the caveat system—the expense under the law being comparatively smal

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the final fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making up this case we have no excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; this demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of an article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be secured. Likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEE and SHAREHOLDES, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammelled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it

Mining and Scientific Press.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, May 13, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

PROGRESS OF THE PETROLEUM INTEREST.

We learn from Mr. Sevenoakes, who has in charge the works of the Pennsylvania Petroleum Company, that the work of boring is proceeding very satisfactorily. The well was down 181 feet at noon on Tuesday last, and the workmen were progressing at the average rate of one foot per hour, working twelve hours per day. Mr. S. brought up with him to this city a sample of the oil and water, as it comes from the well. The indications are most unmistakable. This well is located directly on the sea coast, and about six miles south of Santa Cruz. It is now about two months since Mr. S. commenced the preparations for boring, and it was eighteen days Tuesday since they commenced boring. The auger is worked by horse-power. The nature of the ground is such that no tubing is required at this well.

Mr. Sevenoakes was the first in the State to commence sinking a well for oil. His first work was under a contract with the Santa Cruz Petroleum Company, whose ground is located some five or six miles from that of the Pennsylvania Company.

Considerable work is being done in boring for oil near Lexington, about fifteen miles beyond San Jose. The first work done was by some Portugese, who sunk an open shaft, at first for coal, but at a depth of 115 feet the indications are such as to lead to the inference that by boring a short distance from the bottom of their shaft they will find oil.

More recently the Lexington well has been started, which has now reached a depth of 135 feet, with indications highly favorable. This well is tubed the entire distance, and work is still prosecuted upon it.

Shaw's well has quite recently been started. They are putting down an open shaft, which will be continued as such until firm ground is reached; much difficulty being found in tubing through the loose surface ground. Each of the three last mentioned wells are in close proximity to each other. There are very extensive indications of oil at numerous other places on land in the vicinity of these wells, the owners of which are waiting anxiously for some determinate developments in the wells already started.

We have heard nothing new during the past week from the Adams, or any other wells now in progress south of San Francisco, except those mentioned above.

COLUSA COUNTY.

According to the Colusa *Sun*, boring operations have been commenced in earnest in Colusa county, by Messrs. Rowe & Fleeson. Machinery for that purpose is already on the ground. The point selected is about a quarter of a mile below Simmons' Spring. They have commenced boring by hand; and in the meantime these gentlemen are having a twenty-foot overshot wheel constructed, to be run by the water of Sulphur creek, which they will soon be able to employ in driving their machinery. As this work will test the fact of the existence of oil in productive quantities in that district, Messrs. Rowe & Fleeson have appealed for assistance in this pioneer work from other parties interested in ground which will be developed thereby. They propose to receive subscriptions for the successful prosecution of the work, for such amounts as parties may deem best, for which amounts they will issue certificates for double the amount subscribed, payable whenever a flowing well of oil is obtained. The plan is a very wise and proper one, and eminently worthy of being adopted in other localities similarly situated.

From the above it will be perceived that the problem of being able to find flowing oil wells in California is still unsolved. There is, however, no lack of confidence manifested as yet in the ultimate result of the efforts in progress. We can have very little hope that *all* will be successful, but the idea that all will *fail* has not yet entered into the mind of any intelligent man who has devoted any special attention to the investigation of the subject of petroleum in California. The finding of a single well, even, will produce quite a *furor* among the hundreds and thousands who are now anxiously waiting for the first "strike."

DAMAGE FROM SODA IN WASHING.—Thirty years ago the linen parts of shirts were worn out before the cotton; now it is the reverse, and both perish much sooner than they used to; the cotton does not last a third as long, in the experience of some of our acquaintances. This hasty rotting of cotton fabrics is ascribed to the hasty processes of bleaching, and to the excessive use of soda in washing—but, in the worst cases, chiefly to the latter. A prudent housekeeper should watch to prevent her servants from using soda to save themselves labor. Servants have been known to buy it with their own money for that purpose. As for those who depend on laundresses, there is no remedy but to find, if possible, a laundress who makes clothes last well. The use of a good washing apparatus should abate this mischief.

THE DIAMOND CEMENT, for uniting broken pieces of china, glass, etc., which is sold as a secret at an absurdly dear price, is composed of isinglass soaked in water till it becomes soft and then dissolved in proof spirit, to which a little gum resin, ammoniac, or galbanum and resin mastic are added, each previously dissolved in a minimum of alcohol. When to be applied it must be gently heated to liquify it; and it should be kept for use in a well-corked vial. An excellent transparent glue, which will be found nearly as good as the "Diamond Cement" may be made by simply dissolving at a low heat one ounce of isinglass in two wineglasses of spirits of wine. Care should be taken not to allow the mixture to boil over.

IMMENSE DESTRUCTION OF PROPERTY.—The destruction of property from fires kindled by the rebels in their retreat from Richmond is estimated at $30,000,000 in gold. The destruction was mostly wanton and useless for military purposes. A great number of persons were burned to death.

TAR IN MAINE.—Sixty barrels of tar, the first ever manufactured in the State of Maine, were recently brought to market and sold for from six to seven dollars per barrel.

A YOUTHFUL MURDERER.—A little girl was recently shot in Hillsdale, N. H., by a boy only ten years old. The act was done coolly, deliberately and knowingly.

SYDNEY papers state that a new gold field has been discovered near Rockhampton, Australia.

SECRETARY McCULLOCH'S LETTER.

The new Secretary of the Treasury, Mr. McCulloch, is generally considered one of the ablest financiers in the country. His opinions upon financial matters are almost universally quoted as the best of authority. He has recently written a letter to Thompson Campbell, of this State, in reply to enquiries from that gentleman concerning his views upon the Specific Contract Act of California. This letter appears to have been very slow in finding its way to the light; but we finally have it, in juxtaposition with some strictures upon the same from the New York *Post*, of April 5th. Mr. McCulloch very clearly, though briefly, expresses the opinion that the Specific Contract Act has done not a little injury to the country generally; but that the injury arising therefrom is more to the disadvantage of the citizens of this State than to the nation at large. He tells us very distinctly that paper money is a necessity to the commercial world, and that we cannot escape its use except at a great sacrifice of our own interests. He says very plainly, and with truth, that California, with her splendid climate, rich soil and great mineral wealth, is far behind what she ought to be in population and wealth. It is a matter of astonishment and regret to many that the people of this coast should be so blind to their own interests by the foolish mania for a metallic currency. The result is plainly to make the rich richer, and the poor poorer.

It is true that California has numerous banks of issue in her soil, and that they never fail to discount; but unfortunately their rates of discount are, in too many instances, fixed at such high figures as to greatly embarrass most of their customers, and work irretrievable ruin to many. In the present condition of our monetary affairs, if we except some eight or ten individual companies, the entire extent of whose claims might be placed within a single quarter section of land, we question very much whether the State itself would not be benefited by an entire diversion of labor from mining to agriculture and manufactures, with the added advantages of the banking facilities generally afforded communities in every civilized country outside the Federal States and Territories of the Pacific. The nation and the world at large would, at all events, be the greatest sufferers by the change. The present high price of labor and interest rendered, to a certain extent, necessary by the anomalous condition of our currency, is an insufferable hindrance to an economical working of our mines. Reckoning labor at its gold value at the East, over one-half if not fully two-thirds of all the bullion taken out at the present time from the mines on this coast costs one dollar and a quarter to one dollar and a half to each one hundred cents; and this when with the universal concurrence of those who are competent to judge, we have the richest mines of gold, silver and copper in the world, and having them, too, in the greatest profusion. These, we hold, are facts patent and indisputable; yet labor cannot, in justice to the laborers, be reduced to a standard which will afford a more economical working of the mines. The reason is obvious; the remedy, however, is in our own hands, and the time, we believe, is not far distant when we can use it without that public detriment which might have occurred a year ago. Will the people be wise, or will they continue to be directed in their monetary affairs by a class of men who fix the standard of flour for working men at sixteen dollars a barrel while they will at the same time sell it for shipment to feed the mongolian races of Asia for eight dollars.

The Humboldt river is unusually high for this season of the year, and is rising. A great amount of snow has fallen and still lies along its upper tributaries; and the warm days have brought out copious contributions to the old stream.

Built on a Gold Mine.—A populous suburb of Melbourne, Australia, has been discovered to have been built on a mine of gold, and drifts are being run under the town for the purpose of working it out.

A Rival of Coal Oil.—A Hartford (Conn.) paper gives the following: In the town of Windsor, on Mr. James Harvey's land, five miles from Hartford, is a spring, on the waters of which, when ponded, rises a coating of tallow, about three-eighths of an inch in thickness. It resembles and will burn like beef or mutton tallow. Near by this spring, on Mr. Harvey's land, lumps of clear tallow have been dug.—*Exchange.*

The substance alluded to is undoubtedly maltha, or mineral tar, also known as sea-wax, a viscid variety of asphaltum, which often occurs of a very light color, much resembling a poor quality of tallow. It melts at a very low temperature, and in cooling assumes the consistence and appearance of cerate, an ointment made of wax and oil. It has long been known as a somewhat rare bituminous substance, and is identical with the *bitumen candidum* (white bitumen) of Pliny. It lacks the pitchy quality which accompanies most varieties of bitumen. This substance probably contains more of the illuminating principle than any other of the viscid varieties of bitumen, and would doubtless be found very valuable, also, for its lubricating qualities. It is less disagreeable in smell than petroleum. It is found on the surface of Lake Baikal, in Siberia, under conditions almost identical with those spoken of in the above extract from a Connecticut paper. It also occurs at the foot of the mountains of Bucktiari, in Persia, and in several other localities.

It is more than probable that the discovery in Smoky Valley, alluded to a few days since in the Reese River *Reveille*, may be of this character, if indeed there was any discovery at all. Many of our interior exchanges are so much inclined to perpetrate "jokes," that it is sometimes difficult to extract the real from the ideal, in many of their notices of new discoveries.

The Proposed School of Industrial Science, at Worcester, Mass., to which we have already alluded at some length, is about to become a fact. We notice that the conditions under which the offer of $100,000 was made are to be promptly complied with. A committee of citizens was appointed to raise the additional amount required, who have commenced their efforts with the most cheering results.

It is understood that this institution will afford instruction to persons intending to enter upon practical life, such as manufacturers, farmers, mechanics, or to pursue various branches of commercial business, and that it will supply a want long seriously felt, but which our public schools and colleges have very inadequately met. The principal aim is to impart such knowledge of mathematics and of the sciences as will be found of practical value in the useful arts. The range of studies will be adapted to this end, and the school will be free to the inhabitants of the city and county of Worcester. The platform is as broad and liberal as that of the common schools of that State. It is emphatically an enterprise for the people. The value of such an institution can scarcely be estimated.

A new school of this description is now being inaugurated in Paris, under the direction of M. Albert Cohn. These schools are beginning to be properly appreciated in Europe, and their results upon the industrial interests are most unmistakable.

Coal Oil still keeps up its recent advance, with very little prospect of any immediate decline. The recent destruction of large quantities of oil by freshets in Pennsylvania, coupled with the idea that California will soon begin to produce her own oil, having had a tendency to greatly retard shipments to this port, dealers have advanced in expectation of an early scarcity.

Horses.—It is estimated that the war has reduced the number of horses in the United States fully one million in number. The average destruction in the Federal army alone has not been less than 500 per day. The average use of horses in the various departments, taken collectively, is about one horse for every two men.

The Mariposa Estate.—This estate, which in the hands of a prudent manager would be a princely fortune, appears to have become, in reality, a beggarly concern, not paying even its own expenses. This want of success is doubtless due to a lack of judgment, coupled with individual speculation in its management. The company, despairing of being able to have it worked by its direct agents, have finally turned it over to the Messrs. Dodge, of this city, who hold the majority of its indebtedness. A lease has been made to these gentlemen—including all the mines, mills, machinery, goods and chattels thereunto belonging—for the term of one year.

Under the new *regime* the miners employed are to work the mines for wages—if they can get that much out of them, and if not they divide what they do get—the lessees not being responsible for the pay of the hands. Any surplus goes toward cancelling the old indebtedness of the company. In consideration of this arrangement, all attachments against the company have been released. The attaching creditors consent to this arrangement, and the object is to work out the debts of the company. Dodge Bros. have a high standing in San Francisco as honest and sagacious business men, and being in easy circumstances, pecuniarily, can more readily push through the heavy business connected with so important and complicated an undertaking.

Be Careful of Your Lamps.—The danger of blowing out kerosene lamps from the top is greater than people generally suppose. There are several instances on record, where lives have been lost by the explosion of lamps from this practice. The following explanation of the causes that produce the explosion are worth considering and heeding:

First—The oil in the lamp is generally low, leaving more room for gas.

Second—The gas is very inflammable, and will always explode when ignited.

Third—In blowing the blaze down it ignites the gas.

The inference is, a lamp should never be blown out from the top. The wick may not perfectly fill the tube, and the flame may go down when the gas covers up.

Fourth—The less oil in the lamp the greater danger.

There is another practice, which we have already adverted, but to which it may be well to again refer in this connection. Many persons, when going to bed, are in the habit of turning the wick down low in order to save a trifle of the consumption of the oil. The consequence is that the air of the room soon becomes vitiated by the unconsumed oil vapors, by the gas produced by combustion, and also by the minute particles of smoke and soot which are thrown off. Air thus poisoned is deadly in its effects, and the wonder is that more are not immediately and fatally injured by breathing it. Irritation and inflammation of the throat and lungs, headache, dizziness and nausea, are among its effect.

An Old Salt Well.—a few miles from Clarksburg, Penn., was lately re-opened after having been closed for many years. As soon as the earth which covered the top of the well had been removed, and the plug taken out, a large stream of gas mingled with petroleum issued from it. The indications are that there is oil in great abundance. This well is on the west fork of the Monongabela river.

His Age.—Brigadier General John Fredcrick Hartrault, the gallant officer who recaptured Fort Steadman and turned the momentary defeat into a success, is a native of Montgomery county, Pa., and is a little less than thirty-five years of age. The recapture of this fort was the turning point in the seige of Richmond, and indeed of the war.

Oil.—There are now five hundred and forty-three petroleum companies in existence or in course of formation, with a capital of upwards of $356,000,000.

The Sandwich Islanders have struck oil, having gone into the manufacture of that article from the castor beans that grow wild on Hawaii.

The cannonading at Richmond was distinctly heard at Arlington Heights, Washington, a distance of over one hundred miles.

Mining in Colorado.

The business of quartz mining, including the working of silver ore, has been reduced to system by numerous experiments and long practice under very various conditions. So far as gold is concerned, it is admitted on all hands that money invested in mining rock which will yield an average of $25 per ton, will return a large interest, if used with good judgment. A few days since we gave the average assay, by competent chemists, of one hundred and fifty samples of Colorado ores. It was $156 per ton. We also cited instances in which from fifty to three hundred and seventy-five dollars per ton had been obtained from our ores by simple stamp mill. Late last season there was discovered a belt of silver veins running from the head of the Vasquez on this side of the Snowy Range, to the head of the Snake, on the other. Several assays of silver ore from these veins showed the presence of silver at the rate of from $500 to $2,000 per ton. Only slight holes were sunk. We have no doubt another season will develop silver mines in Colorado, as rich as those north and south and west of us. We recently published the financial statement of the Briggs' Company of this county, showing their net profit from an 18-stamp mill for eight months to be $100,000, currency. It is not long since the Black Hawk Company shipped 1,743 ounces of gold, the product of ten weeks run, of forty-eight stamps on ordinary Gregory ore. This last was at the rate of $435.66 per diem. The Narragansett Company's *new* mill (20-stamps) on the Gregory has been running five weeks, and though the ore has not been at all carefully sorted, they have taken up 600 ounces, or at the rate of (this gold coins $17.50 per oz.,) $350 per day. The Quartz Hill G. M. Co. A., Mausur, agent, running on the Burroughs, has cleaned up 480 ounces of gold from a *new* 12-stamp mill, in sixty days—at the rate of $130 per day. Mr. Warren Hussey has been running his 24-stamp mill in Nevada a good share of the time during the winter with about the same result as the last mentioned instance. During the last five weeks in which Mr. Field's mill (12-stamp) was running, ten thousand dollars worth of gold in currency was taken out. Before the Smith & Parmelee Company were so badly pestered with water in their mine, they shipped regularly (24-stamp mill) 150 ounces per week, or at the rate of $400 per day. During the last twenty months, Mr Sensenderfer's mill has run ten. It has twenty stamps, of medium weight, and took out gold in that time which sold, (at all rates of premium, from 125 to 285, and back to 150) for $80,000. These facts are given to show the results of gold mining in Colorado at present. They were brought about, all of them, under unfavorable circumstances. But very few of those mentioned are *mining*. They are preparing to mine. They are sinking shafts, running adits and cross-cuts, timbering, hailing, doing everything, in short, but systematically working out of a good vein of ore. They are none of them deep enough to have permanent veins of sufficient width to admit of working without taking down a certain proportion of wall rock. Many of them are following three or four veins, divided by keys of granite, taking out occasional "horses." They are universally troubled with water in the mines, there being but two pumps in operation in the Territory. It would be tedious to mention all the obstructions met with and annoyances suffered in the business in its present incipient state. These things should be taken into account in deciding as to the profit or loss of the business.

Queens of France.—France has had sixty-seven Queens. Miserable lives they led. Eleven were divorced; two executed; nine died young; seven were widowed early; three cruelly treated; three exiled. The rest were either poisoned or broken-hearted.

"Babylon is falling—is falling," was the tune to which the veterans of the fifty fifth Massachusetts marched through the burnt district in Charleston to their new position on James island.

In the march through South Carolina, 14 towns and cities were taken, hundreds of miles of railway, and thousands of bales of cotton burned, 85 cannon, 4,000 prisoners and 25,000 animals captured, and over 15,000 white and black refugees were set free.

The Pope, it is said, has forbidden the "Life of Cæsar" to be circulated in Rome. This is to pay back the emperor for closing the mouths of the clergy in respect to the encyclical.

New York is exercised about the dangerous condition of that city in respect to fires from petroleum. It is estimated that there are 40,000 barrels of this most combustible commodity stored below Fiftieth street, in that city, much of it without the slightest precaution against fire.

[Written for the Mining and Scientific Press.]

Precious Stones at Mokelumne Hill.

MESSRS. EDITORS :—You have perhaps heard ere this of the reported discovery of precious stones, such as opal, agate, diamonds, etc., in a hill near this town, by a party of Frenchmen who lately arrived from France, and it is said with a knowledge of their existence and locality here, imparted to them by a returned countryman. However true this may be, certain is that a *jewel* excitement is the latest talk here, and it is still raging. As a consequence the whole hill is staked off into *diamond* claims.

It is further stated that this returned Frenchman sold two diamonds of great value in Paris, and from the fact that these Frenchmen here are industriously at work in search of more, the story gains credence, and in consequence all kinds of stones—except precious ones—are every day pocketed by those now engaged in this new field of industry.

Our gold mines having ceased to attract attention from abroad, and receiving but little at home, I see no *good* reason why we should not have now a diamond excitement. It is well known that Mokelumne Hill has been a rich mining camp, and that the county of Calaveras is still as rich as any county in the State. We can easily show that we have already produced enough of the precious metal, out of which might be manufactured some article of jewelry for each and every person in America; and who knows but that the time has now arrived when we can furnish each with a diamond or other jewel to set therein? We have heard of the poets' three ages—the gold, the silver and the brass, or brazen age. That we are now living in the latter is patent to all; but who has ever heard poets speak of this jewel of an age which is dawning upon us? Already the refulgent rays of its morning sun are beaming over *this place*, and their reflected light is seen in each sparkling, precious, brilliant found in or among the alluvial deposits of "Stockton Hill." Who can say after this that we are not a favored people? If such there are, they had better be careful how they speak of us, because we are a *great* people, and although at peace with the world and the rest of mankind, we might get offended and show fight. And this puts me in mind of another discovery. It is that of the

LANGSHORE BREECH-LOADING CANNON—A CALIFORNIA INVENTION.

Through the kindness of the inventor, Mr. Langshore, who is an old resident of Mokelumne Hill, I have been shown a model of this breech-loading cannon, for which he intends taking out letters patent.

Breech-loading and revolving cannon, have been patented in this country and also in France, Austria and Switzerland; but I believe from some cause or other, they have never come up to the expectations of their projectors and have invariably failed to meet with the approval of competent military engineers. In Switzerland only have their projectors found favor and encouragement from the government. Yet the time is fast approaching when war will be waged, and battles fought, in which cannon will be the only weapon used. I am not aware what the objections were to those guns. One, I presume, is due to the difficulty experienced in getting a perfect air tight joint between the breech and gun barrel, a difficulty which Mr. Langshore has, I think, overcome by a very simple contrivance. The nature of this improvement consists in the novel method of adjusting the breech or chamber piece, which contains the charge, to the gun barrel. These chamber pieces—of which there are several—are slid in or out from either side of the gun, at pleasure, along a *tramway*, with a turn-table attached, and are so arranged that as the charged chambers are passed in on one side, those discharged may be passed out on the other and there re-charged, and *vice versa*. Mr. Langshore further says that while these "chamber breeches" are made of steel, and cubical in form, that the gun itself may be made from any other material now used for ordinary gun metal, the explosive force being spent in the "breech chamber"—as it is in the cylinder of a Colt's revolving pistol. I must add that each one of those cube "chamber pieces" holds but one charge, and that the opening in the breech of the gun is just large enough to admit it, and when in is held in its place by five screws which are simultaneously turned by a small crank in the breech proper, also, that this gun is intended only for ships or fortifications, yet guns of this style are no heavier or more cumbersome than any other of the same calibre.

Mr. Langshore will soon pay your city a visit, for the purpose of submitting his model to the careful inspection of competent persons and soliciting aid for the enterprise. He would also like to know something more of those great guns now in use, as he is entirely ignorant of gunnery and military engineering, and moreover has no ambition to be called a warrior. Yours truly, R. W. D.

Mokelumne Hill, May 8th, 1865.

MORE DISCOVERIES IN HUMBOLDT.

We have seen at the office of Mr. Flanagan, No. 606 Montgomery street, a fine lot of specimens brought from Humboldt, Nevada, by Mr. P. B. Dixon. On conversation with Mr. Dixon, we learn that himself and associates, a party of Humboldt miners, are the fortunate discoverers of a new mineral region located about thirty miles west of the famous Humboldt salt mine, and directly south of and adjoining the Pine Wood District and 115 miles from Virginia City. The mines are located on the opposite flanks of a mountain range, running nearly north and south. Two districts have been formed, one on the east side of the mountain, known as the Mineral Belt district, and the other on the west side, called the Argentaura district. The company which has been organized to develop them is known as the Argentine Mining and Exploring Company. The number of ledges located is sixty; the greater portion of which are in the Mineral Belt district, and comprised in a space of one and a quarter miles wide by four in length. The mines located in the Argentaura district are found within a space of about two and a half miles square. The specimens from these ledges are quite different, as a general thing, from the ores which are usually sent to this city from Humboldt. They consist of chlorides, bromides, sulphurets and free gold.

The specimens from one of the veins are very rich in free gold, a thing somewhat unusual, we believe, in Humboldt ores. The specimens are all from the surface, and the veins are easily traced. The company has secured a large tract of wood land, lying between the two districts, amply sufficient for all purposes of steam power and timbering. Each district is watered by two small streams, affording an ample supply for steam and amalgamating purposes. The mines are quite easy of access. Mr. Dixon is now on his way to New York, with a view of securing Eastern capital for their development. We have seldom, perhaps never, seen a collection of mere surface indications which look as promising as those of which we have been speaking. We wish the adventurers the fullest measure of success, and shall be pleased to chronicle any progress which they may make in their efforts, or any new developments which may be made upon their ground.

ARIZONA.—The Governor, District Attorney, Judges, Marshals and a goodly array of gentlemen of influence and capital, to say nothing of a fine array of military force, recently left this city for Arizona. The affairs of the Territory will hereafter be conducted with energy and upon a more reliable basis than heretofore. There will from this time on, be no step backward in the development of that region, which stands next to Sonora in point of mineral value. A fine quartz mill and everything connected therewith, complete, has also been shipped by Mr. Tyson who proposes to avoid the uncertainty and delay attendant on the long voyage around the Peninsular of Lower California by land, and up the Colorado by steam, by hauling the machinery across the San Bernardino deserts in wagons. The mill is intended to be set at work on the celebrated Vulture ledge in the heart of Arizona Territory, a long distance eastward of the Colorado river.

IN OPERATION AGAIN.—We notice that the fires have again been kindled at the Glass Works on the Potrero. During the cessation of work, important improvements and additions have been made to the furnaces. They have now a full force at work, and have recently obtained several experienced hands from the East. The establishment is now in a much better condition for work than at any previous time.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

THE SEVEN-THIRTY LOAN.—The New York *Tribune* of April 13th, says that the subscriptions to the seven-thirty loan on that day reached $3,526,000. The largest Western subscription was $102,000, from Chigago; and the largest Eastern, $358,000, from New York. There were also 2,468 individual subscriptions of $50 and $100. The telegraph of Wednesday last reported the subscription during the six days ending May 7th at $40,387,000—nearly *seven millions* per day. On the ninth, the subscriptions reached the enormous sum of *fifteen millions* for that single day! Five millions were taken by a single New York house, probably on European account.

CALIFORNIANS IN CHILE.—The irrepressible Californian is rapidly enlarging the sphere of his usefulness. Letters from Valparaiso announce that fifty men from this State are on their winding way to Tucapela, place in the Auracania where some gold mines have been discovered.

COMSTOCK.—This celebrated prospector has returned to Virginia City from the Boise River mines.

A VALUABLE BOOK FOR MINERS AND MECHANICS.

Messrs Wheeler & Rundall, of this city, have now in press a work, which, though small in compass, is replete with statistics and information especially valuable to miners and mechanics. We have looked over the proof-sheets of the greater portion of the work, and find it has been prepared with great care and much research, and with special reference to giving the largest amount of information in the smallest space. Among the subjects treated upon are the extraction of silver ores by all the various known processes—the patio, Freyberg, Augustino, Teirvogel, Patera, Veatch, etc.; also the separation of silver from and by liquidation, cupellation and the Parke process. The various processes for the assay of the ores of gold, silver, copper, galena, iron, etc., are also successively given; also blow-pipe assays and tests; also receipts for various cements, chemical receipts employed in amalgamation processes, for making black flux, solders, etc. The mechanic will find a solution and explanation of numerous mechanical problems; methods of calculating water and steam powers; the average efficiency of various kinds of water wheels, their velocity, etc. Numerous tables are also given; table of pressures, temperatures and volumes, tables for estimating the mean pressure of steam from a given cut-off; tables of co-efficients for estimating the horse-power of water wheels and steam engines. In fact this book appears to be just the little mining and mechanical hand-book needed by the California public. It is being printed at the book and job printing office of the Mining and Scientific Press.

A California Publication.—We would call especial attention of our mining friends to the advertisement, in another column, of Kustel's work on the Nevada and California Processes of Gold and Silver Extraction. This is one of the most valuable metallurgical works extant, and for miners, prospectors and millmen in California it is almost indispensable. This work has now been before the public long enough to have its merits fully appreciated by all who have availed themselves of its existence, and we are pleased to learn that it is becoming generally introduced among miners. Those who have not yet met with the work will find in the advertisement above alluded to the plan of it fully set forth. The author has succeeded in preparing a work particularly acceptable and useful to that class of our producing community who have not had the advantages of a thorough laboratory or metallurgical education; to that end he has avoided as far as consistent technicality of expression, and prepared his book to perform the office of an instructor in plain English, and with especial reference to the nature and difficult circumstances of treatment involved in California and Nevada ores. That it may be placed within the reach of everybody, the price has now been reduced to five dollars per copy. See advertisement.

The Next Industrial Exhibition of the Mechanics' Institute.—By resolution, at a late meeting of the Mechanics' Institute, the present board of officers were appointed an Executive Committee for the full management of the coming exhibition. They were also empowered to add further names to their number. We understand the committee are now actively at work, and we hesitate not to say that the citizens of San Francisco and the people of the State may confidently anticipate that the Fifth Exhibition of the Mechanics' Institute will be the grandest affair of its kind ever attempted on this coast. The Fair, it is expected, will open in August. The circular of the managers, we understand, will soon be issued, and we shall hereafter speak at greater length upon this important subject. The following names comprise the executive board: Charles M. Plum, President; Josiah Monlton, Vice-President; P. B. Dexter, Recording Secretary; C. S. Higgins, Corresponding Secretary; Edward Nunan, Treasurer; Directors:—A. A. Snyder, H. K. Cummings, W. W. Hanscom, James R. Deane, David Dwyer, D. A. Macdonald, J. W. Ready.

A Terrible Sacrifice was recently made in Brooklyn, N. Y., at a fire in a building which was built on the bank of the heights overlooking East river. Earth was spread over the roof of the building and used as a garden. As it ran on a level with the street above, the Chief Engineer ordered the firemen to go on the roof, and there fight the flames. Firemen, like soldiers, are expected to obey orders, and when remonstrated with by bystanders, could only reply that they were ordered there and must obey orders. They remained; but soon there was a crash heard; the roof sank into the burning mass below, and all upon it—some twenty in number—were precipitated into a yawning gulf of fire. The sight was petrifying, and it was some time before the comrades of the unfortunate men recovered self-possession sufficient to enable them to go to their rescue. When they did, it was with the utmost speed, and they succeded in getting out a few slightly maimed, others more so, but eight had perished—literally roasted alive. The affair is looked upon generally as a sacrifice to a want of judgment and a lack of brains upon the part of the Engineer.

A Correspondent writes us from Aurora, enquiring after a certain turbine wheel which was on exhibition at the Mechanics' Institute Fair, in this city, last fall. The wheel to which he refers is the invention of Mr Fauchery, whose advertisement and address he will find on page 300 of this issue of the Mining and Scientific Press.

An extraordinary instance of determined endurance has just occurred in the prison of Alcald, in Spain. A man named Puehla condemned to death for murder, in his dread of the garotte determined to starve himself to death. He resolutely refused all food, and on the twelfth day expired from exhaustion.

P. T. Barnum, the great showman, is one of the Union candidates for member of the Connecticut Legislature in Sanford county.

Mining Companies and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal Railroad and Financial Advertiser, New York.*

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Astonishing Illegality of Mining Advertising!

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

Advertising in Supplements has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through misapprehension of the law, on the part of advertisers.

We do not aim to raise unnecessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

NOW IN ITS TENTH VOLUME.

— THE —

Mining and Scientific Press,

— THE MOST —

Profitable Newspaper

— FOR THE —

Readers of the Pacific Coast.

Issued Every Saturday Morning.

DEWEY & CO., Publishers.

Our Journal enters its Tenth Volume with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the Mining and Scientific Press substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,

An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,

An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,

And a Helpmeet to All Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Office—No. 505 Clay street, corner of Sansome.

DEWEY & CO., Publishers.

C. W. M. SMITH.....W. D. EWER .....A. T. DEWEY.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent., including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its exemption from state and municipal taxation, which adds from one to three, per cent. more, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,

Subscription Agent, Philadelphia.

April 15th, 1865. apr15-3t

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4¼ cents per pound.

H. C. SKINNER,

San Jose, California.

San Francisco, April 27, 1865. 17q10

ANGEL ISLAND SILVER WARE.—The statement that fine specimens of silver ware are manufactured from silver extracted from Angel Island rock, San Francisco Bay, will probably be received with incredulity. Yet such ware does exist. The lady of Major Andrews, commanding on Angel Island, has in her possession one of three beautiful soup ladles manufactured from silver and gold taken from a ledge on Angel Island. The ladles weigh about seven ounces each, and each contains about eight dollars worth of gold the whole being the product of one ton of rock taken out and worked at the time some excitement was occasioned by the reported discovery of silver mines on the Island. Some day the Island will doubtless be worked to advantage for its silver ore, but at present military regulations prohibit any work on the ledges.—*Call.*

DR. JOHN KILPPART. has been appointed by the Commissioner of Agriculture to visit Europe, "to collect agricultural statistics," under a provision made by Congress for that purpose. Agricultural education; its influence on agriculture; systems of agriculture to be observed; what plants are in general use for the table, for commerce, and for medicine; the system of breeding, rearing and managing cattle, horses and sheep—are some of the prominent subjects to which his inquiries will be directed. Some six months will be spent in visiting the best agricultural portions of Great Britain and the Continent.

THE Napa *Reporter* says that the crops are sadly in want of a few rain-falls. The warm weather of last week has scorched and withered the grain sprouts, and fears are entertained by many that the damage will be severe.

OIL.—The California Petroleum Company filed its certificate of incorporation on Saturday last. Location of land, Colusa county. Capital stock, $50,000.

BLASTING

POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA

Patent Blasting Powder

COMPANY.

Office, southeast corner Battery and Commercial streets.
Room No. 9, with San Francisco Chemical Works,

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10qy

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.
THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.
PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

POPULAR SCIENCE.—Men of genius, in former times, have often languished in obscurity, not because their merits were neglected, but because they were not understood. This, however, can scarcely happen in the present day, in which all sources of useful information are laid open, and in which unparalleled exertions have been made in the higher classes of society to diffuse improvement and promote all objects of inquiry which can benefit or enlighten the public. There are other uses, still greater uses, resulting from the communication of general and popular science. By means of it vulgar errors and common prejudices are constantly diminished. It offers new topics for conversation, and new interests in life. In solitude, it affords new subjects for contemplation, and for the active exercise of the understanding; and in cities it assists the cause of morality and religion, by preventing the increase of gross luxury and indulgence in vicious dissipation. Man is designed for an active being, and his spirit, ever restless, if not employed upon worthy and dignified objects, will often rather engage in mean and low pursuits, than suffer the tedious and listless feelings connected with indolence; and knowledge is no less necessary in strengthening the mind than in preserving the purity of the affections and the heart.—*Sir H. Davy.*

CHANGING THEIR BASE.—The Crescent Extension Quartz Mining Company, of Indian Valley, Plumas county, have filed the certificate of removal of their place of business from Indian Valley to San Francisco.

UNASSESSABLE.

First National

PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,

Room No. 20 Government House,

SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

A new and very sensible fashion is beginning to prevail in Hartford in regard to funerals. It is this: the funeral services are held, the assembly is dismissed, and all except the family and other relatives of the deceased return to their homes; afterwards the hearse and carriages come, and the body is accompanied to the grave by the family only. Great expense in the way of carriages is thus avoided. This custom might, with much propriety, be introduced into this city, where the funeral expences are so high, by reason of the foolish custom of providing carriages for all who wish to take a ride, as to be out of all reason in the case of people of moderate means.

The "Camanche."—This vessel is still lying at Mare Island, where extra work is being done upon her. A plank deck is being placed over the iron deck, the latter being too hot in Summer and too cold in Winter.

Fares by the "Sacramento."—The Pacific Mail steamship *Sacramento*, for Panama on the 18th instant, has fixed her rates for passage to New York as follows: First cabin, $200; second cabin, $150; steerage, $80.

Singular Larceny.—Some thief stole a pump in Stockton, a few nights since, from a corner where it was put up, by private parties for public use, over ten years ago.

Bombay now contains a population of 816,562. Two hundred years ago it contained but 10,000.

MINING LAWS AND FORMS.

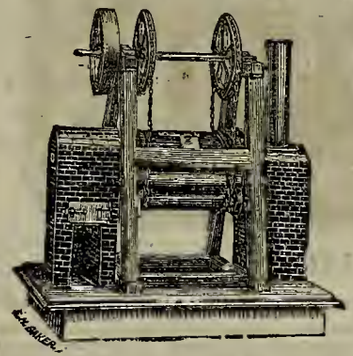
NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard



Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mulcback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA, WASHOE, ENGLAND, FRANCE,

—AND—

THE ATLANTIC STATES.

These Machines, or circulars contniuig further information regarding them, may be obtained of the undersigned.

Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the

PACIFIC FOUNDRY,

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 8th, 864.)

nov8 3m* HEPBURN & PETERSON.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

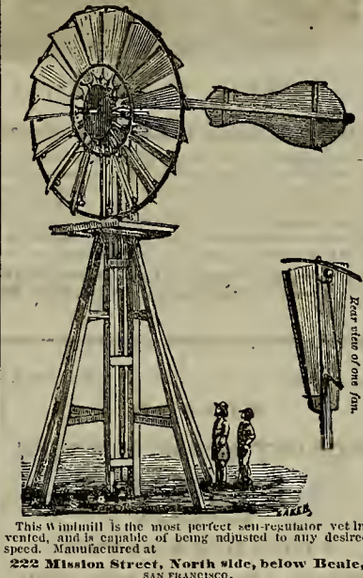
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

CALL AND EXAMINE SAMPLES.

Sent by mail, if desired. Address

DEWEY & CO.,

16v10-tf No 505 Clay street, San Francisco.

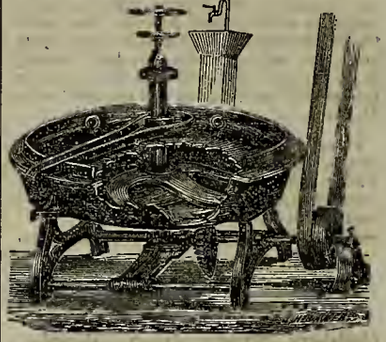
TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.



The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street.
15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco,

Committee of Awards.

O. Belden, O. Gori, W. T. Garratt, Geo. Johnson, H. P. Wakeler, C. M. Radcliff.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

19v9

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surfaces of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay..... 250	943	Assay 300	990
Assay.....255	941	Assay for Cochran	980
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	993
Assay.....		.....St. Helena Ledge, W. D.	966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assays. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

WALNUT CREEK PETROLEUM COMPANY — The certificate of incorporation of the Walnut Creek Petroleum Company was filed on Tuesday. The object of the Company is to work a certain tract of land known as the Ranch San Miguel, or de los Bolbones, containing coal, asphaltum, petroleum and other oils, situated in Martinez District, in the county of Contra Costa. The capital stock is $500,000. Trustees: Alonzo Green, C. L. Place, Samuel Tetlow, R. C. Moore, and C. M. Radcliff.

INVENTORS AND INVENTIONS.—Let us not cheapen inventions, but be kind to the inventors; beware of killing the goose that lays the golden egg! Many inventors die before the hour of triumph; others falter by the way. Invention is a struggle, a conflict, almost a battle; if the victors are rewarded, the dead are honored and the wounded carefully attended to. Glorify the inventors who succeed; cover with an indulgent self-respect the faults of those who fail; and soothe the last years of the wounded—those invalids of industrial science who have known only the pains of the fight, and always remained ignorant of the joys of victory. —[Dumas.

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTINO CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 20, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

EXTENSIVE CHALK BED.—The Montana *Post* of April 15th, chronicles the following:—

A most valuable discovery has been lately made in our vicinity. Judge W. Y Lovell, one of the best assayers in our city, showed us a piece of chalk, as fine in texture as any imported. A bed forty feet wide has been found on Pipestone creek, in the Pipestone district. A careful analysis has proved the genuineness of the article and also the existence of traces of silver in it. The discovery is the more remarkable, inasmuch as we are informed that hitherto very few deposits of this mineral has been found either here or in the United States.

THE State Prison in Main earned $4,000 more than its expences last year, The institution has proved so profitable that the State authorities propose to build another one.

A SPLENDID brick flouring mill, to be driven by steam power with five run of stone, is being erected in Stockton in time for the business of the season.

SUEZ CANAL.—The opening of this canal to navigation throughout its entire length, from the Red Sea to the Mediterranean, has been officially announced to all the chambers of commerce in Europe.

D. S. CUTTER. W. H. TOBEY.

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,
9v10-1m No. 4 Cedar street, New York.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDICIAL District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,
By G. C. LETCHER, Deputy Clerk.
C. Sims, Attorney for Plaintiff. 7v10-3m

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are but so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,
GOLDEN ERA BUILDING,
No. 543 Clay street, near Montgomery, San Francisco.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,
No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of May, 1865, an assessment of 7½ cents per share was levied upon the assessable stock of said Company, payable on the 6th day of May, 1865, in United States gold coin, to the Secretary, or to W. W. BURR, at Clayton.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 19th day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. B. WINEOAR, Secretary.

Office, 308 and 310 Front street, San Francisco. my6

La Victoire Copper Mining Company, of Haaser's Valley.—Notice is hereby given, that the office of said Company has been removed from Bear Valley, Mariposa county, to the city of San Francisco, at No. 606 Merchant street. The following are the names of its Trustees:

E. DUPRE, E. RONDEL,
V. POUPION, P. HUERNE,
B. CAEL.

Its officers are:

E. DUPRE, President,
A. BOREL, Treasurer,
G. F. PETRARCHI, Secretary.

By order.

my6 O. FRANCIS PETRARCHI, Secretary.

La Libertad Gold and Silver Mining Company, Cacachillas District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of April, 1865, an assessment of twenty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 20th day of May, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 5th day of June, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

WILLIAM VALE, Secretary.

San Francisco, April 17, 1865. apr29-td

NOTICE.

A Meeting of the stockholders of the Rough & Ready Gold and Copper Mining Company, Rough & Ready District, Nevada county, Cal., will be held on Monday, May 15th, 1865, at the office of the Secretary. Proxies must be filed. By order of the Board of Trustees.

C. W. M. SMITH, Secretary.

San Fraacisco, April 29, 1865. apr29

Silver Creek Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.—Assessment No. 4.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 21 day of May, 1865, an assessment of one dollar and twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to S. A. HAWKINS, Superintendent, at Silver Mountain.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 10th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 24th day of June, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
W. D. ROOT, Deputy.

Office, No 413 Montgomery street, San Francisco.

NOTICE.—At the above meeting of the Board of Trustees of said Silver Creek Mining Co., Assessments Nos. 1, 2 and 3, levied July 8, 1863, August 6, 1863, and September 22, 1863, respectively, were rescinded, and stockholders having paid said assessments will be credited on the above assessment (No. 4) with such amount so paid. Also, notice is given, that the above assessment (No. 4) of one dollar and twenty cents was levied for the months of February, March, April and May, 1865, being a levy of thirty cents per month on the capital stock of said Company for the aforesaid months, and in conformity with the by-laws of said Company.

J. WARREN CLARK, Secretary,
my6 W. D. ROOT, Deputy.

J. S. BROWN, Secretary.
apr29 J. WARREN CLARK, Deputy.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on his coast.

SUBJECTS FOR THOUGHT.—A correspondent of the Oakland *News* says: "We all love flowers, plants, shrubbery, with their aroma, beauty and variety. Men build costly houses, with finest carvings and decorations; immediately the shurb, the plant and the vine are trained up the lattice work; the windows, doors and sides of the house are covered with the rich foliage—the rooms are darkeaed, and not a breath of pure air can find its way to the nursery or sleeping room or any part of the house; and what is the consequence? Children become, pale, lose their appetites, become restless and feverish, with disturbed rest. Result: the doctor, sickness, if not the shroud, the coffin and the vacant chair! Think of these things."

The Grass Valley *Union* makes the following sensible remarks upon a similar subject:—"It is a very common thing to see mothers and servant girls pushing along over side-walks the little carriages in which they are giving infants an airing on pleasant days. The practice is a very dangerous one, and is liable to do great permanent injury to the child. We observe also that carriages are now so constructed that they may be pushed instead of drawn. The position of a child, riding backwards instead of forwards, is an unnatural one, and directly effects the brain of the infant. Some grown persons, even, cannot ride backwards in a railroad car without experiencing a sense of faintness, and to expect a child to do what a strong adult cannot, is to say the least. It is believed by medical writers, that infants have died from diseases produced by being ridden backwards. We hope mothers will remember this, and impress it on the minds of their servants. Check the first attempt to ride the little innocent backward; and you will remove one of the causes of congestion and brain fever to which children are so liable."

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GUIDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras; and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

☞ That it may be within the reach of everybody, the **price has been reduced to FIVE DOLLARS.**

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

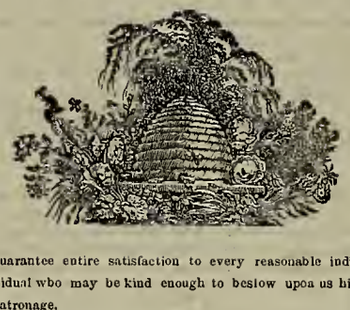
THE OFFICE OF THE

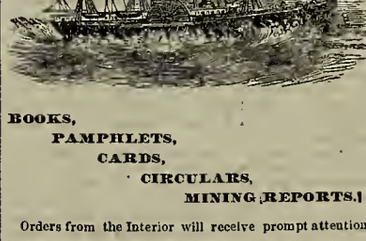
Mining and Scientific Press

Has been removed to the old printing stand lately known as Waters Bros. & Co.'s, southwest corner of Clay and Sansome streets (one block south of our former location), where we have consolidated with a



JOB PRINTING OFFICE,

One of the oldest and best appointed establishments in the city for



CHEAP, RAPID AND FINE PRINTING.

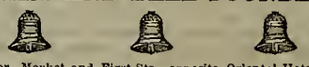
We are well prepared to do good work, and as cheap as any prompt and reliable firm in San Francisco, and will

guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

LAW BRIEFS,
MINING CERTIFICATES,
PETROLEUM CERTIFICATES,
BLANK BOOKS,
MINING BLANKS,

BOOKS,
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages will be forwarded by mail at our expense.



City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renowned health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, at 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

RECOMMENDATION.—Dr. H. Austin, whose card appears in to-day's issue, is one of the oldest and most reliable dentists in San Francisco. He has practiced constantly in this city for fourteen years, and occupied his present rooms, No. 634 Washington street, during the past eight years.

Mining Summary.

CALIFORNIA.

Our summary of mining news, for the present week, is rather more meagre than usual. We place before our readers such items as have come to hand.

MARIPOSA.—Some very good strike have recently been made in looso quartz on the hill east of the town of Hornitos. Several thousand dollars have been taken out within a few weeks, by hand mortars.

From Hunter's Valley we still continue to receive good returns. The Mariposa *Gazette* says that the La Victoire claim is paying better than ever before. Large quantities of ore are being daily shipped. It is reported that good copper ore has been struck on an extension of La Victoire. The erection of smelting works has been temporarily postponed, but the advantages accruing from the saving of cost in the matter of freight by the reduction of ores upon the premises, are well known. Smelting furnaces will be forthcoming soon. Prospecting in a thorough and effective manner will undoubtedly develop other veins equally as rich.

Floyd's quartz mill at the head of Temperance creek has been steadily running for several weeks past, crushing quartz for J. W. Adams & Co., proprietors of the Oakes vein. Reported to be paying well.

Stock in the Great Western Copper Mining Company is favorably spoken of. Holders do not seem inclined to sell.

CALAVERAS.—The Noble copper mine, at San Domingo, is about to be started in to work again. The San Andreas *Register* says that work has been suspended there for some time on account of some differences among the proprietors, not on account of any lack of confidence in the mine.

The Chloride Ledge Mining Company filed its certificate of incorporation a few days since. The company is organized to work a lode known as the Chloride ledge, located in Blue Mountain District.

SIERRA.—A correspondent of the Downieville *Messenger* says that Goodyear's Bar shows great improvement at the present time over what has been seen there for two years past.

The American Company, at Morristown, have six or eight pipes playing, and will do a tremendous season's work; their water coming from the highest snow region, will give them a long season. They recently cleaned up $9,000 from six days' run.

The Pittsburg claim, at Howland Flat, lately declared a dividend of $1,285 to the share.

Twenty thousand dollars was shipped from Howland Flat on Monday of last week.

PLUMAS.—The Crescent Company recently cleaned up, after two weeks' run, about $8,000, showing an increase of returns. The Indian Valley mill has just made a shipment of $1,000 in bullion. Bidwell appears to be taking the lead just now, so far as returns are concerned. The Lone Star and Waterworth mills at Greenville recently retorted $7,500 for one week's run, and the next week did better still.

Bidwell & Co., of Greenville, says the Quincy *Union*, recently shipped $17,000 to San Francisco, the proceeds of two weeks' run in their quartz mills near Greenville. The rock crushed was taken from the McClellan ledge.

NEVADA.—Badger Hill is rivaling its ancient fame. According to the *National*, out of fifty two tons, from the above mine, which was crushed at the Gold Hill mill, a few days ago, $109 to the ton was realized. The company are now running an incline tunnel into their claims, and have attained the depth of 120 feet on the same.

WASHOE.

The Virginia *Union* learns, through Mr. F. A. S. Jones, of that city, that machinery, complete, for the erection of works for separating metals from ores by the "Disintegrating Process," an account of which we recently gave in the MINING AND SCIENTIFIC PRESS, is now on its way from New York, for the purpose of being put up in Alpine county. It is said that the process and machinery has been satisfactorily tested in New York on ores from the Morning Star, Constitution and American lodes, and that Mr. Jones has purchased the right to its use for Alpine county. We shall be pleased to record its success, when put to a continuous and practical test. Practical experience on a working scale is the only way to test the value of any improvement, and we should look upon those who assume the initiative of such experiments as public benefactors.

The Bacon M. & M. Co. have declared a dividend of $10 per share, or $200 per foot, being the first or No. 1 of what we trust will be a long series. This mine is situated contiguous to the Imperial and Alpha Companies' claims, and wheels into line as a dividend paying institution at a time when confidence seems acking in the perpetuity of all interests on the Comstock lead.

A streak of excellent ore some two feet in width has been found in the Justis mine, and is now being worked. A considerable amount of the ore has already been taken out for crushing and will soon be sent to the mill.

Two-thirds of the dam of the Ophir mill, on the Carson, was washed away on Wednesday night the 10th inst., by the high water and the accumulation of drift wood. This accident will deprive the mill of its water-power for some time, as it cannot well be fixed until the river falls.

Active operations have been commenced at the Pinte copper mine, on Walker's river, forty-five miles from Virginia. Mr. William Garrard, of Copperopolis, is superintendent of the mine, which is said to be exceedingly rich. The ores on the surface are carbonates, what they are below is not known, as the lead has been followed down to no great depth.

ESMERALDA.

The Citizens' Prospecting Company, or organization, having for its object a thorough development of some one or more of the mines about Aurora, is progressing finely. A sufficient number of shares have already been subscribed to ensure a speedy commencement of the work. The *Union* says that Mr. E. B. Poole and others have just opened a new ledge on Last Chance hill, from which they have had twenty-five tons of unassorted rock worked at Winters' mill, which paid $100 per ton. They now have 150 tons of assorted rock at the mill, which they expect will turn out still better.

REESE RIVER.

The *Reveille* receives most flattering intelligence from the mines of Eagan Canon. Those owning interests there are quite generally at work upon their development. Similar encouraging advices are received from Smoky Valley. The Smoky Valley company have struck what they suppose to be $300-rock at a distance of 150 feet from the surface, but still above the water line. The Everett and other companies are progressing with the work of development.

Mr. Banks, superintendent of a New York company for mining in Pine Wood District, will soon commence operations. Machinery for mills and hoisting works is on the way, by the Isthmus. Goss & Lombard, of Sacramento, are at work on part of the machinery.

The Morgan & Mancy mine is extending its incline in depth, and continues to develop a vein constantly increasing in value. They are now down about three hundred feet, with a regular vein near that depth; but the indications are that they have struck a "horse"—the first of that character we have heard of at Reese River. The vein is divided—the pay rock, however, still occupying the larger portion of the vein. The ore is still intermixed with bright ruby silver, and glistens with shining sulphurets. The entire vein pays over $200 to the ton.

BOISE.

Gen. Humason, says the Dalles *Mountaineer*, of a late date, is now engaged in shipping an eight-stamp quartz mill for the Boise Basin. In connection with one or two others, Gen. H. is the owner of several very rich quartz claims, the rock from which he designs to crush with the mill now going forward. The mill, with engines and everything complete, was manufactured at the foundry of A. C. Gibbs & Co., Portland, and is pronounced as complete as any similar lot of machinery ever turned out on the Pacific coast.

Considerable of a stir is noticeable in Lewiston, says the *Radiator*, in reference to the new mines on the tributaries of the Grand Ronde river, many believing that the new diggings will prove very rich. Parties are making preparations to start a new town at the mouth of Grand Ronde river, about twenty-five miles from the mines. The new site is accessible for steamboats.

FROM EL DORADO CANON.

A postoffice has recently been established in El Dorado Cañon, and Mr. Frank S. Alling appointed Postmaster. This is a want which has long been felt in that region, and an attainment which will doubtless be duly appreciated. We learn from our attentive correspondent there that the New Era mill commenced working on the 21st ult., and that teams are busy hauling quartz from the Tecbetticop mine for this mill. They have a contract for crushing 1,000 tons of ore. Operations on the Waitt Consolidated mine were commenced on the 29th ult. The miners on the Tobias have struck exceedingly rich gold rock, and are taking out large quantities. They are anxious for the new mill to commence running so that they can have their rock crushed. Mr. Wilburu, of the Cotton Wood Island, some twenty-five mile below the Cañon, is running a line of first-class barges between the Island and El Dorado Cañon, delivering a good quality of wood at the mill for $12 per cord. The barges are propelled in calm weather by Mohave-Piute power; but the wind so favors most of the time that they can dispense with the men-power. The little steamer Esmeralda is still tied up at the month of the Cañon, but expects to leave soon for the lower country. Mr. Bauta, of the Queen City mine, is still pushing ahead with his work, and has upon his dump the first pile of ore to be seen in the Cañon. A small pack-train left about the 25th ult., for the Salt Mountain, to load with salt for the quartz mills. This salt is of a very superior quality, and is chopped out with axes.

CANAL ACROSS THE ISTHMUS OF DARIEN.—The official organ at Bogota, in a recent issue, says that a contract has been concluded between the Executive of the New Grenadian Government and the agent of a French company, conceding to the latter the exclusive privilege of constructing a canal across the Isthmus of Darien, from the Gulf of San Migbel to that of Uraba. The Contract awaits the approval of the Senate.

Improvement in Working Bed-rock Tunnels.

The running of bed rock tunnels is one of the heaviest expenses which owners of gravel claims have to incur. These tunnels are run from the base of the hill through the bed-rock into the hill, for the purpose of strikiog the chanoel where the hest pay is found. This having been done, the claims are worked through the tunnel. Such tunnels have been run at Quaker Hill, Birchville, Swcetland and other places on the ridge, where mines are now paying large amounts. Some of these have required as high as ten years to complete them and a great outlay of money. At the claims of Clark, at Smartsville, where such a tunnel is being run through solid slate rock, an experiment was tried a short time since, which greatly reduces the expense and expedites the work. The tunnel spoken of has cost $200 per foot. A few days since Mr. Clark tried the virtue of fire as an agent, and found it to work to a charm. A cord of wood was placed in the end of the tunnel and left to burn, after which the rock was found softened and easily worked, and at an expense of about twenty-five dollars. By this method he succeeded in running the tunnel two feet further into the hill. We learn that the experiment will be continued and the method improved by the construction of grates, to which cars can be attached, and hose, for the purpose of cooling the tunnel after the fire has done its work. We have no doubt that this new style of running tunnels will be generally adopted where the rock is subject to the action of fire. Granite can be worked to even better advantage than slate, we should judge. In the case above spoken of $375 was saved by Mr. Clark's method and considerable time gained. We commend this matter to the miners of the county.—*Nevada Transcript.*

Remarks.—We called attention to the advantages of the application of fire to the breaking of ground in running tunnels, in the number of the Mining and Scientific Press dated the 24th of September last, in which article it was stated that previous to the application of gunpowder in blasting, fire was largely employed by miners, from the most ancient times, in softening the rock previous to its being removed by gads, etc. The last locality in Europe, where, until quite recently, it was used, was in the ancient Rammelsberg mine, in the Harz Mountains. There the natural inclinations of the miners to follow the traditional customs of their fathers, and their superstitious aversion to modern innovation, resulted in keeping up the practice, as a general rule, long after it was elsewhere entirely abandoned. In fact, it has never been completely abandoned in Saxony, and quite recently the practice there has become more common, and efforts have been made to improve and further utilize the use of fire for such purposes. A careful series of experiments has been made during the past year, under the direction of Herr Fickentscher, at the St. Christoph mine, near Breiteshrunen. It had already been attempted, in the same place, a few years ago, by Herr Cloter, but was abandoned on account of the high cost of wood in that neighborhood. Coke has now been substituted for wood, as more economical and less objectionable on other self-evident grounds. The coke is used as follows: A small, moveable frame, very much like a common coal grate, is so constructed as to be placed on legs or other support against the face of the wall to be broken away. The front of the grate should be closed so as to drive the heat as much as possible against the wall, and openings left at the bottom for draught. With a closed fireplace, thus constructed, about one and a-half bushels of coke will burn through an entire night. In the morning the fire-place is removed, and the hot wall sprinkled with water to cause it to become more friable by contraction in thus suddenly cooling. The effect of the fire generally extends to the depth of about eight inches. A great economy is found to be derivable from this process. As coke is not attainable as yet in the mines on the Pacific coast, perhaps charcoal might be found preferable to wood as it can be more readily handled in the narrow walls of a drift than wood, and the fire be more easily controlled. We should be pleased to hear more fully from the operations at Quaker Hill, and have little doubt but that the experiments in progress there may be of much importance to the mining interest.

Tellurite of Gold and Silver.

STANISLAUS MINE, CALAVERAS COUNTY—MELONES AND STANISLAUS MINING COMPANY.

This very interesting mineral, found in the Stanislaus mine, accompanied by some other rare combinntion, exhibits some singular appearances, differing at the same time from the tellurite of silver-gold found in Nagyag and Offenhanya (Transylvania), in its physical and chemical properties.

The Melone tellurite of silver-gold is found accompanied by tellurite of silver, native tellurium, antimonial nickel, iron pyrites and free gold, in a matrix of quartz with some talcose rock and lime spar. The tellurite of silver resembles, in color, the tellurite of silver-gold, being a little darker, with metallic lustre. It is easily recognized by hammering little particles on an anvil. While the other minerals turn into powder in this process, the tellurite of silver remains flattened, like silver-glance, but not so dark as the latter. It contains 62.8 per cent. of silver, the balance being tellurium. The native tellurium is distinguished by its nearly tin-white color and metallic lustre. It contains no silver and no gold. The antimonial nickel resembles the arsenical pyrites, but has a pale, copper color. It contains twenty-nine per cent. nickel.

The tellurite of silver-gold has a dark steel-gray color and a bright metallic lustre. When a small fragment of it is placed on a nearly red-hot coin, or very cautiously heated with the blow-pipe on a piece of charcoal, so as to avoid melting, the color of the mineral will change suddenly to yellow. This change is only apparently so, by being coated with emitted metallic gold. Under the microscope it presents a very brilliant piece of art made by nature in a very singular way. The mineral fuses at a temperature a very little above that of melting lead. On a heated coin the fragment cannot melt; still the gold, requiring about four times the temperature of melting lead, appears on the surface of the mineral. Being the smallest part in the combination with silver and tellurium, it separates from both unmelted metals, changing its place to the surface. If stronger heat is applied the gold disappears again before the mineral melts. The efflorescense of silver from silver-glance, tellurite of silver, stephanite, etc., is well known; but this takes place after the mineral is melted into a globule and cooled.

Both the tellurite of silver-gold and the tellurite of silver contain some seleuium. The tellurium reaction of that mineral on charcoal and in glass tubes is less characteristic than of the like mineral from Transylvania; but the reaction in treating the ore in a tube with soda and charcoal powder is very intense.

The analysis of tellurites of silver-gold from Transylvania, and from the Stanislaus mine, may be interesting for sake of comparison. No. 1, analysis by Klaproth; No. 2, by Bercellius; No. 3, by Plattner; No. 4, ore from Stanislaus mine (blow-pipe analysis). The amount of tellurium in No. 4, is not found by analysis, but by calculation on the amount of gold and silver, there being only very little seleuium in the combination.

	No. 1.	No. 2.	No. 3.	No. 4.
Tellurium	60	51—52.00	59.4	35.40
Gold	30	24.00	26.3	24.80
Silver	10	11.33	14.3	40.60
Lead		1.50		
Specific Gravity		5.7 to 5.8		9.0 to 9.4

No. 4 has very near the proportion of metal and tellurium, as is found in the tellurite of silver, which contains 36.20 tellurium and 62.8 silver. A correct blow-pipe assay of No. 4 can be obtained hy taking only twenty-five miligrams, or forty grains, with ten times as much pure lead into operation.

The tellurite of silver-gold cannot be reduced in iron pans without perfect roasting. There are no difficultics in roasting, and according to experiments on a small scale no loss in gold or silver, but it is a condition for a proper roasting to have the ore in a fine pulverized condition. The melting of the tellurite into globules cannot be avoided; hut if the ore is finely powdered, the globules will be minute, and, loosiug their tellurium, whicb escapes in fumes as tellurous acid, turn soon into white metal. After four or five hours roasting, a sample is taken from the furnace, worked, and by means of a magnifying glass examined. If the small globules appear white, the roastiug is done and the ore amalgamated as usual.

If smelting is prefered, the ore requires a closer selection or, eventually, concentration. The tellurite joins eagerly with lead in a melted condition for this reason; if the ore is rich in tellurite of silver-gold, a very convenient reduction is offered by the cupelling-process, in which the ore is added in small quantities of ten or fifteen pounds to the red-hot lead at intervals, depending in regard to time on the more or less earthy matters of the ore. From time to time the slag is drawn off until the lead is considered to be rich enough to be separated from the gold and silver by continuing the cupellation to the end. The mineral does not require here to be fine except on account of the earthy particles Being combined with a great deal of rock the smelting must be performed either in reverheratory or blast furnaces, with ores rich in lead.

The high specific gravity would allow a close concentratiou, but for the tendency of that mineral to assume a leaf-like shape; when reduced to fine powder, the separation becomes more complicated and requires, with reference to the richness of the mineral ($82.32 per pound), a systematical way of concentratiou. This ore is brittle, and at the same time very tender; it is much sooner crushed into small particles than the rock, consequently it requires to be crushed, coarse, first, in order to save the coarse mineral particles by separation and proper concentratioo, from being pulverized into dust, which always incurs a greater loss. The course part of the tailings must be heated in another battery with fine sieves and subjected to a concentration suitable for fine material.

The Stanislaus mine has been worked to a limited extent, the shaft being only a little over two hundred feet deep. The ore is found in layers of quartz, talcose slate and lime-spar, extending sometimes to a considerable width, and for many feet in length. The ore is generally very rich. The mine is a valuable one and deserves a more vigorous pushing in both directions, but especially downwards. Judging by analogy of similar mines, the increase of the tellnric silver-gold may be expected below four or five hundred feet in depth. This was the case with the Nagyag and Offenbanya telluric silver-bearing leads. The mine of Nagyag, especially, proved very rich below four bundred feet. G. K.

The Ophir Mine—Work on the joint shaft of the Ophir and Mexican mine, says the Gold Hill *News*, is progressing in fine shape. The shaft is now down five hundred feet, substantially timbered the entire distance, and the progress amounts to not far from six feet every twenty-four hours. Lately the water in the bottom has largely increased in volume, and to-day the work of putting in the lower pump commences, and in two weeks will be completed, at which time the process of sinking will be renewed and pushed with all possible vigor, until such a depth shall have been reached as will cut the ledge and thus drain the the water from the central shaft, where doubtless exists a fine body of ore. The work now being done is precisely what should have been done at least two years since, and then the company instead of having to hire their fine mill to other mines, would have been adding to our daily shipments of bullion; for there is hardly a practical miner in Nevada but that believes a fine body of ore does exist at a greater depth. At present but little ore is being taken from the Ophir mine, and that is from "pockets" passed by in palmier days. Only twenty men are at this time employed, and even that force is to be for the present reduced. We are glad to see our old "boss," James Dickey, Esq., in Superintendency of the Ophir, for he is as good a foreman for a mine as ever balanced a bucket, and under his experienced care, we believe the Opbir mine will, within a short time, demonstrate the fact that a five hundred-foot level does not end the grand Comstock ledge.

Queen Victoria recently had a most miraculous escape from being crushed to death by the falling of a huge elm tree in the Home Park. She was taking an airing on her favorite Scotch pony, and proceeding through the tall avenue of elm trees at Windsor known as Queen Elizabeth's Ride, a groom following at a short distance, when providentially, the servant observed one of the large trees falling immediately over Her Majesty. The man called out loudly, and Her Majesty, made aware of the danger by this timely alarm, escaped being crushed beneath the tree by a few yards only.

Ingenious Expedient.—Mr. E. M. Wright, a jeweller of Marysville, says the *Appeal*, has erected a steam fan over his work bench. Mr. W. has a pocket steam engine in his shop, to which he has attached machinery for working a fan to keep away flies and at the same time waft the cooling breezes.

Not the struggle, but the flight of pain, beautifies the person; hence the countenance of the dead is transfigured because the agonics have cooled away.

Danger in Sinking Oil Wells.—As the work of sinkiog oil wells is now in progress at a great many points in California, it may be well for the public generally to bear in mind that much precaution should be used in the employment of fire about the wells. The gas, which appears to occur in unusual quantities in the vicinity of oil indications is very inflammable when mixed with atmospheric air. An Atlantic paper in speaking of this matter cautions oil well-borers as follows:—

In the oil regions, when the precious fluid is struck, great care is necessary to prevent accidents. The gas, which is the first indication that the reservoir has been reached, rushes up with great force, and, being highly combustible, it is dangerous to have fire anywhere near the well; even a pipe or cigar has in some cases caused the explosion of gas, causing the destruction of life and property. In a few instances the gas has become ignited and burned for weeks, the mouth of the well being converted into a mighty gas burner, from which the flame rises many feet in hight. Only a few days ago a gentleman, by the name of Jacob Crowe, was sinking a well on George's Creek, Fayette county, Pa., and when the drill struck the oil deposit a powerful volume of hydrogen gas ascended to the surface, filled the atmosphere, and coming in contact with a stove in a shanty some distance from the well, a terrific explosion ensued, and the flame darted into the air sixty feet high. Fortunately no one was injured, and the flames were finally snbdued; but experienced borers never permit fire any where near the well upon which they are working.

The Ophir Mine.

The Virginia *Union* says that the recent sudden advance of the stock of this mine was in consequence of a new strike at a depth one hundred feet below the former works, in a drift from the new shaft. We had heard of a seam of clay being struck several days ago, that prospected very well; hut they have since reached the ledge and found a body of good ore.

We record this fact with the greatest pleasure at this time, as it has a tendency to bruce up the backbone of the frightened stockholders in our principal mines, who lose confidence whenever the hears desire to run the stocks down by misrepresenting them. The history of the Ophir will be that of all our mines. It is the nature of silver mines that barren places should be found, cutting off the pay vein temporarily, and stopping the dividends. But, like the Ophir, they will strike it again on going deeper. It has invariably proved so in all cases in this vicinity, and may he taken as a criterion in judging of our mines in future. Even though two or three of our big mines should happen to lose the pay vein at the same time, it is no cause for the display of so much folly as we have seen lately exhibited by timid holders of the stocks. This having a panic every year because the professional stock operators start unfavorable reports about the mines, ought to learn the people who hold the stocks, that the bottoms of the mines do not fall out as often as represented. They ougbt to know hy this time that our mines have a permanent character, not to be destroyed by the breath of stock gamblers in San Francisco. If the idea of the permanency of our mines is once established in the public mind, as it should be by the developments already made on the Comstock lode, there will be no more of these idiotic panics such as we are now being disgraced by. Let men gather up their scattered senses and return to reason in time to save themselves from entire ruin.

Vegetable Silk.—A French settler in Senegal, Africa, has written to *Le Moniteur* that a new textile has been discovered which bids fair to be of great use. It is a sort of vegetable silk, which grows in long pods like a banana. When ripe, the pod hursts like that of a cotton-plant, and a rich silk tassel, of excessive fineness, falls from the stem. The fibre of this tassel is very tough, notwithstanding its great delicacy. The principal difficulty seems to be in finding a suitable method of cleansing this substance from the gummy matter and seeds. The plant in question is called *Aftacus Sengalensis.*

Force of Water.—As an illustration of the force with which the water poured through the principal streets of Rochester at the recent flood, the Rochester (N. Y.) *Democrat* says that a car-wheel weighing 500 pounds was carried from a foundry 3,000 feet distance, and landed on an island in the middle of the Genesee river. The Sacramento *Bee*, in noticing the above, says that during the last Sacramento overflow, railroad iron—not wheels—was swept by the flood from R street to E street, a distance of over a mile.

The California Oil is not Asphaltum.

LETTER FROM PROF. SILLIMAN.

NEW HAVEN, April 8, 1865.

To Hon. D. H. Harris, Springfield, Mass.:

DEAR SIR:—Your esteemed favor of the 3d inst. reached me on the 5th, just as I was leaving home, and I avail myself of the first occasion, since my return, to answer the inquiries you make respecting the California petroleum.

WHAT IS PETROLEUM, AND HOW DOES IT DIFFER FROM ASPHALTUM?

All authors agree, substantially, in stating that the transformation of organic matter (chiefly vegetable), imbedded in various strata of the earth, results in the production of "petroleum or rock oil, naphtha and asphaltum, or mineral pitch, all of which are forms of bitumen, the one being solid and the others fluid, at ordinary temperatures. These differences are, in many cases at least, due to subsequent alterations. The more liquid of these substances are mixtures of oils, differing in volatility, and by exposure to the air become less fluid, and, partly by evaporation, partly by oxydation from the air, eventually become solid, and are changed into mineral pitch." I quote from "Hunt's Essay on the History of Petroleum or Rock Oil," (*Chemical News*, July, 1862), which may be considered a fair exhibit of the state of scientific opinion on this subject. The same author, in the *American Journal of Science*, No. 104, adds: "Under the general name of bitumen, as is well known, are included both the liquid forms, petroleum and naphtha, and the solid varieties, known as asphalt or mineral pitch."

Prof. Brewer's definition of petroleum, in his first letter to you, viz: "Certain mineral oils which do not absorb oxygen, and go through other spontaneous changes in free contact with the air so as to harden into a solid mass readily," is not in accordance with the established opinions of chemists, nor with facts as I have observed them, or as they are recorded by others. I will not cite many authorities, the multiplication of which is easy, but call your attention to the statement by Hunt, that "the latter body (petroleum), like other hydrocarbons, very gradually undergoes an oxydizing process, which, by removing hydrogen and adding oxygen, at last converts the liquid bitumen into substances having the character of asphalt," etc. The crude rock oil from Venango county, in Pennsylvania, which I examined in 1855, as it occurred in pools on the surface of the ground (long before any wells were bored), had a density of 0.882, or of the commercial scale about 30° B., was of a dark brown color, and thick even in warm weather, as thin molasses. Now the same region (Oil creek) yields oils from artesian borings, quite thin, and of 38° to 46° B., or specific gravity 0.839 to 0.802. It would appear from these facts that the Pennsylvania oils do go through "spontaneous changes in free contact with the air."

Under the general name petroleum, are confounded numerous mineral oils of different characters. All of these are compounds of carbon and hydrogen, and all are representatives of a common type, being, so to speak, multiples of common coal gas, all of them the products of the transformation of woody fibre, (or of other organic matters). Every one knows that this gas is a constant product of wells, often being blown out with great violence and in enormous quantities. It is also seen escaping through "tar springs" and oil springs both in California and all other parts of the world, where these natural phenomena have been observed. If you will take the pains to read the article "Petroleum," in *Appleton's Cyclopedia*, which is the best digest of the facts easily accessible, you will find ample confirmation of these statements.

ASSOCIATION OF ASPHALTUM AND PETROLEUM.

Asphaltum differs in chemical composition from petroleum only by containing a small proportion of oxygen. This difference may be either original, the oxygen remaining from the original constitution of the organic matter transformed, or it may be, as already stated, the result of atmospheric action. At all events, in almost all cases, these substances are associated in nature, (as you will note in the article just referred to). The Bakoo oil, on the south shores of the Caspian, occurs in a porous sandstone (of tertiary age) over an area of twenty-five miles by half a mile in width. The oil near the center of the track is clear as if distilled, while that obtained near the side of the track is darker, generally changing to a yellowish green, then reddish brown, and finally to asphaltum.

The same is true of most other localities of petroleum in various parts of the world. In the memoir by Pelouze and Cahours, on the American petroleum, published in 1864, the statement is made, "This mineral oil, petroleum, exists likewise in abundance in Texas and on the Pacific coast, in California, where it is found associated with bitumen." Yet Prof. Brewer says: "I am not aware that petroleum, in the sense in which that term is used in Pennsylvania, is found in California."

It is evident, both in view of its origin and of the facts as seen in nature, that the association of petroleum with bituminous and asphaltic products is well nigh universal, the Pennsylvania oil without asphalt being exceptional. The occurrence of solid and liquid hydro-carbons in the same locality is, therefore, to be looked on as the ordinary state of facts, the high solvent power of the oils enabling them to hold in solution the solid products, giving every variety of liquid from the thinnest possible oil, just blackish with bituminous matter, through the various grades of consistency to the state of a solid.

In California I have seen and described perfectly thin and colorless oil flowing up upon the sea near Santa Barbara. This is a constant phenomenon, long known, and on a scale of great magnitude, existing for many miles up and down the coast, from the Rincon to La Golita. The oil is so thin as to exhale quickly under the evaporating power of the air. On the Azufri mountains behind Buenaventura (the western boundary of Ojai), thin oil exists in abundance; one spring furnishes an oil so thin that I saw it in use for a common hand-lamp, without rectification, in the cabin of the person in charge of the springs. The oil from Humboldt Bay is a light, fragrant oil, burning quite well in a chimney lamp. And the same is true of oil from other localities in California, from Simi Rancho, just south of Ojai.

I have oil which has been subjected to a careful chemical examination, both here under my direction, in Boston, by Mr. Warren, and in Philadelphia, by Mr. Maisch, with the most gratifying results. The oils of California, as they exist at surface, in the crude state, range in density from 0.850 to 0.979, or commercially 36° to 14° B. The lighter, say below 0.900, distill well, yielding from forty to sixty or seventy parts of light oils, and the remainder of lubricating oil. The heavy surface oils yield chiefly lubricating oils, boiling at a high temperature, and requiring careful rectification.

The crude and rectified California oil, exhibited by me to Prof. Brewer, and referred to by him, came from the estate of the Philadelphia and California Petroleum Company, in Santa Barbara county, California.

OF THE SOURCE OF OIL IN CALIFORNIA.

You are right in supposing that my report to the California Petroleum Company has been misunderstood, regarding the asphaltum as a chief source of oil. That a considerable quantity of oil can be obtained from the pools of thin tar or bituminous oil, and from the thin oil which runs down the Mupu Arroya, is quite evident. But it was never supposed by me that any proper development of the estate could be made without artesian borings. That these will be fruitful along a long line in the basin parallel with the axis of the mountain, which extends for thirteen miles, appears to me extremely probable. An effort by a Mr. Gilbert to bore a well on the west end of the estate failed for want of skill and proper tools. I have a section of that well, obtained from Mr. Gilbert's information, which shows that in sixty-two feet he passed alternately pervious and impervious strata with zones of oil, and seams of gas, blowing violently, and beds without oil or tar. That all wells sunk here will be fruitful no one can suppose. But that so much oil can struggle up with bitumen, through the beds, without being also found at no great depth by boring, seems highly improbable. In answer to your inquiry, I would say, localities "oozing at the present time" a substance "fluid and thin," are in many cases properly styled springs of petroleum. Such are the springs on the Mupu, as also on the south side of the Azufri mountain, and at many other points in Santa Barbara county. The oil distilled from the thin tar is chiefly heavy oil. It appears, so far as our knowledge enables us to judge, that the California oil is heavier than the Pennsylvania oil, of equal quality. Burning oil of 38°, from the California petroleum, burns in a lamp with very superior illuminating power, and without smoking. This is heavier than the commercial standard for Eastern oil.

DISTILLATION AND RECTIFICATION OF THE CALIFORNIA OIL.

I obtained 96 per cent. of commercial product from a sample of this oil of a dark brown color, yielding about 46 per cent. of excellent burning oil, and thirty of lubricating oil. Mr Warren, of Boston, operating on the same sample, obtained 93.8 per cent. in about the same proportions. Mr Warren adds, "the odor of the burning oil was extremely agreeable, fully equal in this respect to the best kerosene or refined Pennsylvania petroleum. The other products were also entirely free from disagreeable odor, and indeed the same may be said of the crude oil itself. In this respect it is readily distinguishable from the Pennsylvania petroleum. The burning properties of the illuminating oil are not surpassed by any oil which I have seen. After treatment with acid and soda the light oil and burning oil were nearly or quite colorless. The lubricating oil had a yellowish color. All who had examined these products have expressed surprise at their excellent qualities and freedom from disagreeable odor. The crude Rock oil of Titusville examined by me in 1855, from the surface, yielded no results comparable with these from the best surface oil in California.

The cost of refining products such as these will not be greater than such costs are in other cases. As to the alleged failure of the former attempts to manufacture oil of good quality from asphaltum in California, I can only say, that from my own observations and information, I feel well assured that some of these failures were the legitimate result of want of skill on the part of those who undertook the business, and need excite neither surprise or apprehension when we recall the early history of similar enterprises in Pennsylvania. No person who has any practical experience in oil can fail to note in the distillation of the crude material from California differences which distinguish it from the Pennsylvania material.

OTHER TESTIMONY.

As this subject has excited some discussion and called out some animadversion, it is satisfactory to obtain testimony from independent witnesses who are competent judges. Such testimony comes in an emphatic form from Dr. Letterman, late Medical Director of the Army of the Potomac, who not long ago went to California as general manager of one of the great oil estates in St. Barbara county. Not merely approving the evidence previously given, he advises the purchase of an adjoining estate, which suggestion, I am informed, has been agreed to.

I have already transmitted to you a telegram from San Francico, dated April 4th, stating that Stanford & Brothers of that city, the oldest and largest oil house on the Pacific coast, had sent one of their partners down to examine the oil region of Santa Barbara, and on the strength of his opinion of the existence of oil in quantities, they had ceased importations. From this it appears that actual dealers are satisfied both as to the quality and quantity of oil in Southern California, thus confirming all I have said on the subject.

Believing that I have answered all the points of enquiry in your letter, and, as I hope satisfactory, I have the honor to remain, with much respect, yours truly,

B. SILLIMAN.

CHOLLAR AND POTOSI.—The consolidation of these two important companies and mines being now completed, the newly appointed officers of the consolidation have entered upon the discharge of their duties. A. P. K. Harmon is President, Harvey Beckwith Superintendent, W. E. Dean Secretary at San Francisco, and J. T. Pechey, the former Secretary of the Potosi, is Secretary of the consolidated companies here. All of these appointments are very judicious ones, and we feel that the affairs of the company cannot fail to prosper under their management. Mr. Beckwith's reputation, as former Superintendent of the Mexican mine, always stood among the highest, and Pechey's efficiency as Secretary is fully indorsed in being retained under the consolidation. The mining operations will be conducted through the former works of each company as before, and the best of appliances and arrangements for working are employed. Success to the consolidated and its officers.—*Virginia Union.*

AN EXPERIMENT WITH POTATOES.—Isaac Hicks, of Long Island, writes as follows; A neighbor last Spring cut out all the eyes but the strongest ones, and planted the potatoes in a row, giving them the same chance as others planted in the usual way. When dug, these potatoes, Peach Blows, yield by weight double the quantity of the same variety growing adjoining them. They were also of larger size. His theory is that one good strong shoot, taking its support from a large potato when it begins to grow, will produce much more than when the substance or food is divided among several shoots, or even one shoot with but a small piece of potato to commence its growth with. As this was the fact, will it not be a good plan for others to try the experiment?

NOBLE SENTIMENT.—Condemn no man, says John Wesley, for not thinking as you think. Let every one enjoy the full and free liberty of thinking for himself. Let every man use his own judgment, since every man must give an account of himself to God. Abhor every approach, in any kind of degree, in the spirit of persecution. If you cannot reason or persuade a man into the truth, never attempt to force him into it. If love will not compel him to come, leave him to God, the Judge of all.

ANOTHER DIVIDEND MINE.—The Virginia *Union* says: The Bacon M. and M. Co. have declared a dividend of $10 per share, or $200 per foot, being the first or No 1 of what we trust will be a long series. This mine is situated contiguous to the Imperial and Alpha Companies' claims, and wheels into line as a dividend-paying institution at a time when confidence seems lacking in the perpetuity of all interests on the Comstock lead.

Antiquity of Petroleum.

Petroleum pertains to the history of ancient times. To say that it was known in the days of Herodotus and Plutarch would be to indicate a comparatively modern date. It was known and used in the days of Moses, the leader and legislator of the ransomed tribes of Israel; and long before the days of Moses, the ide of rock-oil was familiar to the prince patriarcha Job. And centuries still beyond, bituminous, concretions were known to the earlier descendants of Noah, when they held a "World's Convention," and designed "a City and a Tower" on the plain of Shinar. And still beyond, the uses of bitumen were known to the antediluvians—"the world before the flood."

In one of his inspired epics, Moses speaks of "Honey out of the rock, and Oil out of the flinty rock."

This poetic and historic mention of rock-oil occurs in an enumeration of the material resources divinely provided for the emancipated tribes of Israel during their migrations through the desert of Arabia. And it is more than probable that petroleum was the pabulum of the sacred light which shone from the seven golden lamps in the Mosaic Tabernacle, and revealed the internal hieroglyphics of that unique and mysterious tent, the regal Pavilion of God. The supply of oil was obtained from the fissures of some silicious rock.

The rock-honey mentioned by Moses is not spoken of as being an original constituent of the rock—of course it is not; neither is it mentioned as being the product of a spontaneous, inorganic chemistry within the rock.

The rock-honey had been collected by the instinct and industry of bees, and stored up in the clefts of the rock. But previous to this it had been originated and elaborated by the activities of an organic chemistry in the living history of an abundant and fragrant flora. And so, also, the rock-oil is not intimated to have been an original constituent of the rock, nor the spontaneous product of an inorganic chemistry within the rock; but in the way of association and analogy, as a product which had been previously originated and elaborated by the activities of an organic chemistry in the living history of a luxuriant and oleaginous flora.

PETROLEUM IN MEXICO.—A recent letter from Mexico states that the interest in discoveries of petroleum continues unabated. Springs of undoubted value have been found at the Hausteca, and at several points in the Department of San Luis Potosi, and on the Tampico river, as well as several places in the Valley of Mexico; and even on the Pacific side, on the coast of Jalisco, the unctuous fluid is said to abound. Where it will next turn up is yet to be known, but "prospecting parties" are on the alert for every shadow of an indication. Covert, McCune and Poole, American residents of Mexico, have come into possession of some valuable springs, and William H. Arnoux, representing a number of New York capitalists, has recently left for the United States with important title papers relative to petroleum, almost under the very "Halls of the Montezumas." Covert leaves Vera Cruz by the English steamer for Havana and New York, with equally interesting information, and representing some of the most valuable discoveries yet made in Mexico. The oil is clear and of good quality, and is accessible by navigable streams. Boring is soon to be commenced on a large scale, for which any amount of capital is in readiness. The exclusive right to refine this oil, which, as stated in a former correspondence, has been granted to some of the above named parties, makes their monopoly of almost incalculable value, particularly when it is considered that they have not only the outside market, but some seven millions of Mexican population to supply—a local trade which is every day increasing, and can defy importation from abroad.

CONDENSED ALE.—Condensed ale is among the latest discoveries. It is the invention of a citizen of Rochester, and he claims that by this method the ordinary extract of malt and hops is reduced seven-eighths in quantity, and to the consistency of sugar-house syrups, without throwing off any of the volatile matter or aroma which brewers seek to retain, if possible; not always with success. The heat applied in cooking the extract is steam, and burning of the liquor is entirely avoided. So that by the peculiar method of brewerage and condensation, the ale is allowed to retain all the finer qualities that impart to it the rare spirit that "cheers but not inebriates." The condensed product is put up in ale casks, and may be shipped to any part of the world, unspoiled by heat of climate. This is the greatest advantage which is claimed for it.

A MAMMOTH ROSE BUSH.—The San Jose *Courier* speaks of a rose bush in that vicinity, of the running variety, the trunk of which is twenty-one inches in circumference, and many of the roses upon which are four and a half inches in circumference.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, May 20, 1865.

No unusual requirement exists for money except for the uses of the Stock Market. Bankers continue to loan to their customers upon prime securities at 1½ ₱ cent. per month, and mortgage loans are negociable at 1¼@1½ ₱ cent. with occasional transactions at even lower figures. In the open market, rates are governed by the necessity of the borrower and the character of his collateral—ranging sometimes as high as 3½@4 ₱ cent. per month, but not often exceeding 2½@3 ₱ cent. Whatever may be thought of the risk of investments for which such rates are demanded, it is quite certain that the money lender is generally well secured and seldom loses. Mining shares are not at present in favor with the bankers as a basis of loans, and upon even the better class accommodations are obtained with great difficulty.

The receipts of treasure continue large, especially from the silver districts, which are, in fact, steadily increasing their yield. The bullion product of Nevada and California since the 1st inst. has exceeded $3,200,000. Gold bars were sold during the week at 830@840, and silver was in fair request at 1 ₱ cent. premium to 2 ₱ cent. discount.

Legal Tender Notes have been in better favor and $230,000 were dealt in, advancing from 74¾e to 78e, receding to 77¾e, and closing at 78 bid, 78¼ asked. Latest telegraphic advices from the East quote gold at about 130.

Large sales of Government drafts on the Sub-Treasurer at New York were made for Thursday's steamer at about the rates current for greenbacks. These checks are payable on demand and are issued by the U. S. Quartermaster of this department for liabilities incurred prior to September last.

The serious depression incident to all stocks on Saturday last, has given place this week to a more buoyant feeling, together with a material rally in nearly every share on the list. Considerable hypothecated stock was sold to cover advances and has gone into the hands of stronger holders, and some sellers' option contracts have proven rather less profitable than was anticipated; in some instances losses were sustained. Large orders for New York account have been received the past few days, some of which are not yet filled, owing to the sudden advance, but many buyers for a rise and a number of short sellers are confident that lower prices will prevail, and are acting upon that theory.

Yellow Jacket declined from $1,400 to $1,200, rose to $1,560, receded to $1,520, rallied to $1,700, fell to $1,575, seller 30, advanced to $1,645, dropped to $1,580, and sold yesterday at from $1,510 to $1,525, within which range 249 feet changed hands. At a depth of 375 feet the west drift (on the vein) some 220 feet from the shaft, continues in good ore, and other drifts are said to show a slight improvement. The product of the mine this week in ore is thought to be up to the average of the past few weeks. Whether the net receipts of bullion for the month will be sufficient to cancel the obligations of the company and enable them to pay a dividend, cannot at present be determined, but the probabilities are favorable.

Gould & Curry is in much better favor since Saturday morning last, and 47½ feet were sold, advancing from $1,240 to $1,650, receeding to $1,620, rallying again to $1,650, and dropping to $1,610, and closing at about $1,660. A good many orders from the East were executed this week, and this circumstance has imparted no little strength to the stock. Drifting progresses vigorously from the D street shaft, and the character of the ledge at a much greater depth than hitherto explored will soon be ascertained. The yield of the mine is averaging some 100 tons of ore per day.

Savage has been actively dealt in and 250 feet were sold, opening at $1,200, declining to $1,075, rallying to $1,300, dropping to $1,200, advancing to $1,320, receding to $1,175, seller 30, then rising to $1,300, again falling to $1,175, seller 30, and closing at from $1,255 to $1,265. The company are hoisting some 200 tons of ore daily to the surface, but the product in bullion is less favorable than for some time past, and the stockholders are likely to receive no dividend for the month of May. Sinking continues from the lower level.

Belcher has been less active than for a month past and only 44 feet changed hands, advancing from $1,010 to $1,200, declining to $1,100, and selling yesterday at $1,090@$1,100. The company are at present working upon a body of good ore in their middle level near the line of the Crown Point claim and a dividend of at least $60 per foot is anticipated for the current month.

Crown Point is in less request and 58 feet were sold, steadily advancing from $775 to $1,020, receding to $950, and closing at about $850. Developments continue upon the north chimney at the 230 feet level, from which portion of the mine some fifty tons of ore are being taken daily. The superintendent is running a drift south, at the same depth, and is also sinking. The new machinery is said to work admirably, and the receipts of bullion for the month of May will probably reach $50,000.

Alpha has met with trifling sales at $1,000, and is now very firmly held at about $975. Latest advices from the mine are said to be favorable, and the liabilities of the company are being rapidly cancelled.

Potosi rose from $325 to $445, declined to $360, and closed yesterday at about $390. Only 87 feet were sold. Chollar rose from $305 to $420, receeded to $350, and sold at the close at $390, some 153 feet in all changing hands. We can learn of nothing favorable from these two claims, but developments are under way which may lead to some improvement. Their product is averaging some 75 tons of ore per day.

Ophir is rather steadily maintained, advancing from $455 to $550, declining to $520, and closing yesterday at $450 bid. The suit of the Burning Moscow *vs.* this company, will, it is said, be tried in June next by stipulation of counsel.

Hale & Norcross is in some favor, and rose from $400 to $455, closing at about $450. At these rates 15 feet were sold. Empire Mill & Mining Company is inactive, but strongly held at about $480 per share.

Minerva declined from $270 to $250, rose to $265, and is now held at $265. Uncle Sam fell to $230, rose to $240, receded to $230, and sold yesterday at $200.

Imperial is now one of the strongest stocks on the list, and has been in decided favor since Saturday last, advancing from $180 to $270 per share, and selling yesterday at $247½. A new body of ore has been found in drifting east 70 feet from the shaft, on the 525 feet level, and at the bottom of this shaft at a depth of 575 feet good ore has also been disclosed within the past few days.

Bullion is in better request, declining from $140 to $130 per share, advancing to $170, and selling yesterday at $160. Burning Moscow declined from $44 to $35, advanced to $43 and closes at about $42. Nevada, (J. G.) declined from $45 to $36, and is now held at $39. Real del Monte was sold at $17, and Wide West at $8½.

The recorded sales of Stocks and Legal Tender Notes since Saturday last, amounted in the aggregate to $1,415,740.

☞ For sale by Carriers and Newsdealers. ☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, May 20, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

THE CROSBY & THOMPSON GOLD-SAVING PROCESS.

In our last issue we gave a somewhat detailed account of Crosby & Thompson's gold-saving process. This process purports to be founded on the result of numerous experiments made upon the sulphuret gold-bearing lodes of Colorado, continued through a period of nearly two years. The constitution of these ores is quite similar to that of the gold-bearing lodes of California which carry a large percentage of sulphurets. The experiments appear to have been confined mainly to what we should call the concentrated sulphurets, but which are found there so free from quartz that no concentration is required, the entire product of the vein being treated as sulphurets. The account which we have given of this process was mainly taken from a "statement" addressed to the public, in which a description of their process was set forth. In addition to this "statement" we have been placed in possession of other publications which have from time to time been addressed to the public through the newspaper press by the inventors of this process, or their friends, and intended to further describe the nature of their discoveries, etc.

This process is based on the assumed or supposed fact that gold in its normal state is volatile, and that its occurrence as a metal is accidental; that the chief portion of the gold which actually exists in the sulphurets is in this volatile state, or exists as a sulphide, volatizing at a degree of heat about one-half of that which is required to melt metallic gold; that the portion of the gold saved by the usual processes employed is merely that which exists accidentally as a metal, and bears but a small proportion to that which is volatilized by roasting on open hearths. It is claimed that by roasting the ore by the Crosby & Thompson process that portion of the gold which so easily vaporizes is collected and condensed in the gas chamber affixed to the discharge end of the roasting cylinders, and that the results vary from twice to six or eight times as much as can be obtained from the same ore roasted in the ordinary way.

We would here mention that Messrs. C. & T. repudiate the term "roasting" as applied in this connection. They very properly say "we can *roast* a potato;" but the term "ustulation" should be specifically applied to the heating of ores to drive off volatile matters. However, as the term "roasting" has come into general acceptance, we prefer to continue its use for the present.

There seems to be various opinions with regard to the loss of gold by volatizing, either during the process of roasting the sulphurets on reverberatory hearths or the ores in heaps, as is a quite general practice in California. As early as 1629, Lazarus Erckern, the then Assayer-General of Germany, published a work on the metallurgic treatment of gold ores, in which he took strong grounds against the practice of "roasting" in the heap, for the reason that careful experiments had satisfied him that a large percentage of the metal was lost by the operation. Since that time much has been written on the subject, and a great diversity of opinion still exists among both practical miners and scientific men on this important and interesting question.

Some twenty years since the Russian Government organized a commission for the purpose of settling the question by a series of careful experiments. The experiments were conducted among the mines of the Ural mountains, and the report of the commission was decidedly against the practice of roasting in the open air, on account of the large percentage of loss. Some experiments were also tried under conditions by which all or most of the vaporous matters were condensed, which resulted in a much less loss of the precious metal.

Trehern, of Marmato, reports some experiments in roasting auriferous pyrites, from which he could obtain only one-fifth as much as he could from an equal amount of unroasted pyrites. Leary made some experiments at the same place, and reported against roasting. As we have already said, Messrs. Crosby & Thompson claim that the working experiments, whereby all the refined gold must be saved shows a yield from twice to six or eight times as great as they can obtain by the process of roasting and amalgamating usually employed at the Colorado mines.

Still we find that the practice of roasting has been almost universally continued to the present day in both Europe and America. Perhaps no one in California has had more practical experience in roasting sulpburet ores than Mr. G. F. Deetken of this city, who communicated some results to this paper, which were published in our issue of March 26, 1864, and from which it appears that he meets with no material loss from roasting. He reports one experiment on some Kern river rock, in which the gold was exceedingly fine. The assays in that instance showed $150 to the ton before roasting and a working result of $140 after roasting—a very small percentage of loss. Another experiment on arsenious sulphurets from Butte county was reported, when the raw ore yielded by assay $620 to the ton, while an assay after roasting indicated a loss of only four per cent.

Notwithstanding the diversity of opinion, the fact is pretty evident to our own mind that greater or less loss does actually result from the process of roasting, and that this loss varies greatly with different ores. We see no other way in which to account for the diversity of results reported. Whether the loss occurs from the carrying away of the extremely fine particles of gold by the upward current of air from the burning mass, as a light wind carries off the finely divided particles of leaf-gold from the guilders' bench; or whether it results from sublimation, are matters for still further investigation. We incline to the opinion that the chief loss is from the former cause.

Most of the experiments showing a large amount of difference in results, reported by Messrs. Crosby & Thompson, appear to have been between theirs and the ordinary working processes in Colorado. We are not informed how these gentlemen crushed their rock, but we presume by a "dry" process, while that ordinarily employed there is a "wet" process; now it is to this fact, we are inclined to think, that the great difference in results is to be attributed, rather than to the roasting process or any peculiar condition of the gold, as in a vaporized form, or as a sulphide.

No person can reflect for a moment upon the extreme divisibility of which gold is susceptible without becoming perfectly well convinced that a very large percentage must pass off with the flow of water necessarily employed in any wet process. Every one must be aware of the rapidity with which gold may be worn away by abrasion against any hard substance, and how utterly absurd it would be to attempt to save, by washing, any considerable portion of the particles thus abraded. What then must be the loss of gold where it is submitted, hour after hour, to the constant and violent abrasion caused by the repeated blows of a 600-pound stamp upon small particles of gold mixed up with the hard fragments of quartz in a battery.

The evidence before us is far from being sufficient to induce us to give full credit to the extravagant mode of superiority claimed for the process of Messrs. Crosby & Thompson. Their assumption that gold exists in nature as a sulphide, or in a volatile condition, capable of being "condensed," is without the shadow of proof; and there is no need of assuming any such thing to account even for the extraordinary results claimed for their process, as we have shown. Their process of "roasting" may be an improvement over anything yet devised; but as they claim at latest dates to have employed it only one month, sufficient time has not yet elapsed to decide upon its economy. The employment of revolving iron cylinders and revolving tables with stirrers, without any suitable lining, has been tried time and again and thrown aside. There may be some peculiarity about the cylinders and air currents as employed by those gentlemen that will enable them to be economically used. Should a continued use prove such to be the fact, we shall most cheerfully give it publicity. Their arrangement of the cylinders, the gas-chamber attached, and the mode of furnishing the cylinders with a free supply of oxygen, must be of great value, if the iron will stand the attacks of the sulphur.

It is a mistaken idea that the metallurgic treatment of gold ores needs no study beyond the mere mechanical separation of the precious metal from its matrix. We have abundance of evidence before us that an important field of research is yet open in this direction; and it is to be hoped that the period is not far distant when a full and thorough investigation of the properties and peculiarities of our gold-bearing veins shall be made by men skilled in both the practice and theory of their metallurgic treatment. A proper exposition of these principles and properties and their practical application to some of our leading gold mines, is a work much to be desired; but the *onus* of such a work should devolve upon the Government.

ROCK SALT IN ARMENIA.—The salt is found in a mountain two leagues and a half from Nakchitchevane, situated on an extensive plain extending along the left bank of the Araxes. The mountain is seven leagues and a half in circumference, and, from the appearance of very ancient works, has evidently yielded salt for many ages. These remains consist of enormous horizontal galleries, supported by pillars of salt; and, according to the traditions of the people, many mines have been abandoned from the difficulties of working them, occasioned by the depth of the strata and frequent inundations. The salt is worked by gunpowder; the works are wrought by the inhabitants of a small neighboring village, consisting of Armenians and Tartars, from three to twenty persons being required at a time. The Russian government has let the works, since March, 1829, for a year, for a sum equal to 16,000 francs.

OIL AND RICE.—Consumers in California who have recently been called upon to pay about twenty-five per cent. advance on the former article, and one hundred per cent. on the latter, on account of the scarcity of those articles in this market, will be gratified to learn that the ship Garibaldi cleared at New York on the 11th of March, with 1,750 cases of coal oil and nearly 8,000 bags of rice for San Francisco. Large quantities are also on their way thither in other ships.

ORIGIN OF THE TERM "YANKEE."

The Southern people have always called all Northerners "Yankees;" but the people of the Middle States have generally repudiated the appellation, and referred the inquirer to New England, and particularly to Connecticut, Massachusetts and Rhode Island, for the genuine specimen of a Yankee. Well, those States have never been very backward about accepting the term, even in the past, and we are inclined to think that even the Middle States men will, ere long, claim a right to the *sobriquet*.

There are many theories given of the etymology of the term. Webster says that it is "a corrupt pronunciation of the word *English* by the native Indians of America, or more probably of the French word *Anglais*." We would beg leave to suggest that the publishers of that valuable work should carefully examine the following piece of information before they issue their next edition: A gentleman of our acquaintance who was never ashamed of the designation as applied to himself, and who hails from the very heart of Yankeedom, informs us that when at home, in his younger days, he numbered among his acquaintances a very intelligent and aged gentleman who was intimately acquainted with the language and habits of the Pequot Indians, the noblest tribe of the race, and whose great chief, King Philip, found a notable grave on Mount Hope, in Rhode Island. Our informant learned from this gentleman that it was customary with that tribe when any two of their "braves" had any personal controversy, for the twain to go out, and decide the point in dispute by single combat. When two parties went thus out they were designated "Yankoos;" after the combat was decided the victor was known as a "Yankee," which, in their idiom, was a conqueror of a conqueror.

It will be recollected that this warlike tribe was the last of all the tribes of New England to submit to the English. Indeed, they fought *single-handed* long after all the other tribes had been destroyed or had thrown down their weapons. From this fact, toward the close of the contest they were in the habit of styling themselves and the English, "Yaukoos"—two braves engaged in single combat. After the death of their chief, and the final surrender of the few remaining braves, they noble accorded to their conquerors the *sobriquet* of "Yankees," or the "conquerors of conquerors."

The glorious result of the contest just closing will now doubly entitle us to the appellation, and we opine there will be less of unpopularity attached to the designation in future than heretofore. We are all Yankees now, and accept the name; and it is a very good one. Will this pass into history as the special designation of the people of the United States in place of the very general designation of American, that we now share with all the other peoples of the continent? If it does, it will merely have the career of all other nicknames before it, which, bestowed in a sneering, jeering sense, eventually became the accepted names of the people or sects. Even the term Christian was at first merely a sneer.

TELLURIUM.—We would call particular attention to the very interesting communication from the well known California metallurgist, G. Kustel, with regard to the Stanislaus mine of tellurite of gold and silver, and descriptive of that rare mineral. With regard to the term which should be applied to this mineral, Dana says "aurotellarite, telluric silver;" Black says "telluride of silver;" but this ore is what is called in German "tellursilbergold"—that is, tellurium with silver and gold. Perhaps the most proper term would be "telluric silver-gold."

OIL.—Forty cases of crude oil arrived at Stockton, on Monday last, from the springs of the San Joaquin and Pacific companies, located in Tulare county. This oil, we understand, was taken to New York on the steamer of the 18th inst.

PITCH AND RESIN.—Large quantities of pitch and resin are now finding their way to this market from Butte county.

THE GREAT LOCK OUT.

The struggle that has been going on for years between the English iron masters and employees, recently reached a crisis, by the refusal of the North Staffordshire puddlers to go to work except at a slightly advanced rate of wages. This the masters refused, and the men held out. After a short time, the masters, finding that the men were determined not to go to work at the old rates, induced their fellow-capitalists at South Staffordshire to unite with them in carrying their point, by closing *their* works also—the "strike" thus became in effect a "lock-out." There are not less than 3,000 furnaces in South Staffordshire, all of which were stopped. It is estimated that not less than 200,000 persons were deprived of their usual means of subsistence by this movement. Nearly one million of dollars that was formerly distributed, weekly, in wages, was diverted to other channels. The duration of the "lock-out" appears to depend upon the action of the original "strikers" at North Staffordshire. The South Staffordshire masters refuse positively to fire up again until the strikers go back at the old rates.

A meeting of the London Trades Union had been held, at which the act of the strikers and the lock-out by the masters were both condemned. It was claimed that the South Staffordshire masters had been guilty of an illegal combination, under the Combination Act, in uniting to suddenly stop their furnaces, when there was no dispute with their men about wages, merely to compel the strikers at North Staffordshire to go to work. The matter was about to be brought before the House of Commons.

The latest advices report the contest as still unsettled, and very little probability that any early arrangement will be made. Under these circumstances, an effort has been set on foot by many friends of the working men to give this movement a practical direction for the benefit of those classes, by removing a portion of the labor to some other country, thereby hoping, in a measure, to do away with the competition for employment, and bring up the price of labor to a standard which shall be acceptable to the employer. The friends of American progress on both sides of the Atlantic are encouraging this movement, for the benefit of our own iron interests; and they are now quite sanguine of very important results—both in the increase of American production, and in the elevation of the price of British labor, the low rate of which has heretofore worked great detriment to the American skilled laborer. To accomplish this purpose, an association has been formed on this side of the Atlantic, which is known as the American Emigrant Company, which has established an elaborate and widespread system of agencies on both continents, all centering in New York. The field of this association embraces other European countries than England—in fact, all nationalities where skilled labor abounds in any degree of excess. The leading objects of the association are briefly stated as follows:

1st. To secure the development of the resources of this country, by the supply of labor being properly diversified.

2d. To elevate the price of labor in Europe and thereby diminish its competing power.

This emigration scheme is giving the iron masters of England considerable uneasiness, as they behold in it a pretty sure evidence of the early downfall of the monopoly of the iron market of the world, which they have so long held, chiefly by virtue of the low rate of wages they have heretofore been able to maintain. To frustrate the scheme they have made the effort to direct the attention of emigrants to Australia and other British possessions; but without much avail, in consequence of the superior inducements offered by the United States agents. It is apparent to the emigrants that where precisely the same wages and terms of emigration are offered, as between the United States and other localities, the advantages of the former are altogether superior; for the reason that should they at any future time wish to change their occupation, and adopt either agriculture or mining, or any other pursuit, the advantages and facilities here presented are unequalled by any other portion of the globe.

The intelligence of the crushing of the rebellion, which is now received in Europe as a fixed fact, will also operate to relieve the minds of European laborers of a thousand silly misrepresentations with which they have long been filled, with reference to the instability of our Government, and other matters prejudicial to any desire which they might entertain to emigrate hither. The "good time coming" for which so many toiling millions have long been waiting, is now at hand—the result of the mighty conflict which we are just closing. The prosperity, security and freedom which the working men of Europe have so long sought for, is now within their grasp, and the means to reach it is furnished them in a free passage to the desired haven. We may henceforward look for a volume of immigration across the Atlantic, to which that of the past, great as it has been, will dwindle into comparative insignificance. The result will be an immense development of our iron, coal, and mining and mechanical interests generally. The benefit to accrue can scarcely be estimated. Would it not be well for Californians to take some measures by which they also may be more directly benefited by this movement?

P. S.—Since the above was in type we have learned from the *Colliery Guardian* of April 8th, that the iron masters of South Staffordshire have concluded to abandon their lock-out and resume work again, leaving the North Staffordshire puddlers still on their "strike." This action has caused a disruption and much ill-feeling between both the masters and the workmen of the two localities. By this movement the lesson has been learned that extensive combinations for the regulation of wages or the acquirement of mastery, may become too big to be manageable, and so fall in pieces. In the meantime, the emigration project has got well under way, and cannot fail of accomplishing important results.

FLOWING OF SAND UNDER PRESSURE.—Sand prepared so as to be uniform and free from dust will flow in the air at angles above thirty or thirty-two degrees, but not at smaller angles. Sand put into a box or reservoir, and allowed to flow out at an aperture, either in the bottom or side, amounts to the same quantity passed, whatever the head of sand may be, or whatever the pressure there exerted, being in this respect quite unlike fluid; so that perhaps it may be made to constitute a moving force probably more independent of deranging causes than any other which can be devised. When a perpendicular tube is filled with sand, very little of the weight is borne by the bottom of the tube; indeed only so much as would equal the weight of a cone of sand standing on that bottom; but nearly the whole is supported by the sides. If a tube an inch in diameter be filled for about six inches or more with sand, and laid horizontally, all attempts to push the sand out of the tube by a stick of the same diameter will fail.

Sand is a great non-conductor of heat. This property is so great that in eastern countries when the surface of a bed of sand at mid-day is too hot to allow the hand to remain in contact with it, the temperature, at the depth of a few inches, is gratefully cool. During the celebrated siege of Gibraltar, the garrison turned their knowledge of this fact to good account. The red-hot shot employed to destroy the Spanish floating-batteries was placed in wooden barrows on layers of sand, and thus carried from the furnace to the batteries, without the wood once catching fire. The above are curious and interesting facts.

PETROLEUM IN RUSSIA.—The existence of petroleum in large quantities throughout the Russian empire has led to the grant of a concession by the Czar to a French company, organized by Marquis la Rochejacquelin, for the utilization of this mineral oil in the production of gas, and the lighting of St. Petersburg on a more economic system than that now in operation.

MARCH OF IMPROVEMENT.—When the project of a canal between Lake Erie and the Hudson was first communicated by Judge Forman to Mr. Jefferson, the latter replied—"It is a very fine project, and may be erected *a century hence.* You talk of making a canal 250 miles through a wilderness! It is little short of madness to think of it at this day." This was in 1809. The canal was not, indeed, made through a wilderness, for that wilderness had become, in a short time, one of the most remarkable examples of human industry to be found in the world. Mr. Jefferson is reported to have observed on a subsequent occasion—"I once said the project of this canal was a century too soon, but I am now convinced I was a century behind a just estimate of the march of improvement in this country." When the act for the construction of this canal passed, it was estimated that the traffic upon it would not, for some years, exceed 200,000 tons; but the very first year it was opened, the amount was upwards of 600,000 tons.

WHAT ARE GOOD INDICATIONS.—Professor Eavens, of Marietta College, says that experience has demonstrated that, as a general fact, supplies of petroleum found at a depth of two or three hundred feet, or more, are much more lasting than those found at a less depth. Oil coming to the surface in bulk, so often considered a proof of valuable territory, is really nothing more than an index of shallow oil. The petroleum has worked its way up through the open fissures to the upper strata, and is rapidly undergoing the process of exhaustion. The most reliable surface indication that the source of oil is deep, is its appearance in a thin valatile scum on mineral springs. The high temperature of oil springs, as compared with that of the ordinary springs is another indication of a deep source. These signs are always found in the best oil regions.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent, And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by procuring a formal application for a patent to the government, embracing a petition, specification, model, duplicate, drawings; and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining Officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or unconnon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge in due proportion to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most reasonable terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, the business can be well attended to by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

Make all your time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We take a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for designs, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the articles.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

MEXICAN AFFAIRS.

Accounts from the city of Mexico, up to the 12th of April, report a steady progress of the Imperial Government in the central provinces. It is not our province to analyze the "pro" and "contra" of monarchical institutions in Mexico; but as philanthropists, we feel a deep interest in the welfare of that unfortunate country, and from whatsoever source or political institution the Mexican people may arrive at the enjoyment of the undisturbed blessings of peaceable progress, such will be hailed by us as a welcome guarantee for the present, and as forebodings of a better future.

Our Mexican correspondent informs us that the 10th of April, being the anniversary of Maximilian's acceptance of the throne at Miramar, had been signalized by the publication of a series of decrees concerning the interior administration of the Empire, viz: Organic statute; a new territorial division into fifty departments; establishment of eight great military districts, each under a General of Division; the creation of a Ministry of Ecclesiastical Affairs; an ample amnesty for press offenders; inspection of customs by French officials, etc., etc., which had been generally well received by the public.

Much discontent continued to prevail among the mercantile community on the Pacific side, on account of a law which appears to have been enacted with a sole view to advance the interest of the Vera Cruz trade, to the detriment of the merchants and consumers of the western part of the Empire. This extraordinary specimen of Imperial legislation, at which a large portion of his Mexican Majesty's faithful subjects feel justly indignant, has attracted much notice, and requires some special explanation.

In the beginning of Maximilian's reign, and as far back as the Regency, the import dues were reduced to fifty per cent., and this facility, decreed by Marshal Forey, and intended originally for Vera Cruz alone, as the only port then under the Imperial sway, was gradually extended to all the other ports of entry on both sides, as they should successively be wrested from the Juarez Government, or adhere voluntarily to the French intervention. In consequence, during all of 1864, fifty per cent. of the tariff of 1856 was the established law for foreign imports, and speculations were accordingly based thereupon.

In November last a decree appeared abolishing the said reduction and re-establishing the former full dues; two months from that date being allowed to vessels arriving on the Atlantic side, and ninety days for those to arrive from round the Horn; after which period all further imports to be liable to full duties. Whatever may be the economical utility, or disadvantages of high duties in Mexico, the Imperial Government were in their unquestionable right when laying down so far their own regulations for international intercourse; yet the difficulties in the application of the new enactment on the basis of equity to the subsequent arrivals, becoming apparent, a modification was introduced and a new rule laid down, which appeared to be more rational. It was declared that all vessels, having left European ports on or before the 26th of December last (on which date it was calculated that the law of the 22d of November could have been known), destined for Mexican ports, should be entitled to the reduction of fifty per cent.

Nothing could be fairer; but to the astonishment of all, in a second article of this new provision, the merchandise imported into the western ports is excluded from the benefit of this boon, without alleging any reason for such an exception! The press in Mexico being fettered, we must resort to our private correspondence, from which it appears that this barefaced injustice towards a large portion of the Mexican people is looked upon as a trick played upon the Pacific ports by the agents of the Vera Cruz tradesmen, and fairly attributed to court intrigue. In fact, it hardly admits of any other explanation, although in our independent community it is difficult to comprehend how *cabal* could bias the better judgment of the Emperor's advisers to a degree utterly disregarding common decency and public decorum, so essential to the dignity of every Government. The decree is signed by the Emperor himself. For the honor of Mexico, let us hope that on mature reflection, Maximilian's honorable feelings will get the better of court intrigue and favoritism, and that his Majesty's counsellors, on seeing their proceedings censured, will subject to revision a law iniquitous in itself, incompatible with the dignity of the Imperial Government, and equally offensive to international treaties and common sense.

GISBOURNE'S ANTI-FOULING AND ANTI-COROSIVE PAINT.—This valuable preparation for the preservation of ships' bottoms, iron buildings and railings, wooden and iron bridges, railroad ties, chain cables, and in fact everything which needs preservation from the weather and elements, has recently been introduced into this city, by T. B. Sherman & Co., corner of Market and First streets. They are the sole agents for the pateutees upon the Pacific coast. This preparation is the only agent which has yet been found a perfect preventative from the fouling of ships' bottoms at sea, and has proved superior to all other agencies for the preservation of wood and iron from the action of the elements. In England the discovery is looked upon as one of national importance, and is now universally used by the Admiralty and Transportation companies. It has been received with equal favor in the Atlantic States, and is now being generally adopted everywhere. See advertisement in another column, and call for circulars, which may be had of the agents.

COPPER SHIPMENTS FROM STOCKTON.—Some idea of the magnitude of the copper interest of Calaveras county may be inferred from the fact that during the first six days of the present month 11,175 sacks of copper ore were shipped from Stockton—8,000 of which were sent forward by C. T. Meader & Co. This is but the average of the weekly shipment, which will be maintained during the present season. In addition to their shipments from the Union, having recently purchased the Newton mine, they have now concluded a contract with the Sacramento Valley Railroad Company for the transportation from Latrobe of 2,000 tons of ore during this season. The Cosumnes Company also expect to ship a large quantity of ore by the same conveyance this year. Two years ago Meader & Co.'s shipments, which were exclusively from the Union mine, averaged less than 1,000 sacks per week. Their shipment on Monday last was 1,310 sacks of copper, 133 of which was what is called, among copper men, matt, and fifty-six pigs of melted copper.

THE GREEN VALLEY MINE, near Hornitos, is again turning out rich rock, which should encourage the miners of that almost deserted neighborhood, to prosecute their labors. A practical working test of 100 pounds of ore taken from the lowest level, was made on the 13th inst., at the mill of Mr. Beath, on Market street, in this city, which resulted in two and three-fourths ounces of gold, (equal to $920 per ton). As noticed in a late number, this mine is now being actively developed by Berhens & Gill, and should be a paying concern.

THE OIL WELL in process of being sunk near Los Angeles has partially caved in; so much so as to cause a temporary suspension of boring operations, until tubing could be obtained from this city. The well is now down 230 feet, and the auger, when the work ceased was passing through a clay schist.

COAL.—We would call attention to the advertisement of Mr. J. R. Doyle, coal dealer, at 413 and 415 Pacific street. As his stock is at all times large, consumers would do well to give him a call, with a certainty that their orders would receive prompt attention.

THE Gold Hill *News* says that there are now three men in Virginia City, agents of New York capitalists, together having command of over $2,000,000 of mine purchasing and working; and these men say if Government currency were adopted here there would be $80,000,000 of New York capital zealously seeking investment in the same way.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

TO CORRESPONDENTS.—"H. H.," from New York, just received—twenty days over-due. "Petroleum—What are we Waiting For?" and "The Oil and Mining Interests of Colusa," will appear next week. We shall also commence, next week, a series of articles on "The Geyser Springs of California."

EN ROUTE.—J. Ross Browne, Esq., the facetious correspondent of *Harper's Magazine*, is on his way to California again, *via* Salt Lake and Reese River.

[Written for the Mining and Scientific Press.]

The Problem of Gold and Silver Extraction--A General Review---No. X.

BY PROF. L. LANSZWEERT.

SULPHIDES.

All metals combine more or less with sulphur and form sulphides, when sulphur is brought in contact with the metal, in the absence of oxygen or chlorine. When oxyds are treated with sulphur in sufficient quantities to absorb all the oxygen in forming sulphuric acid, the sulphur remaining combines with the metal. When sulphates are treated in the presence of carbon or hydrogen, the oxygen of the sulphuric acid is abstracted and sulphur remains. The chemical relation of sulphur to metal is similar to that of oxygen—that is, the number and equivalents of the sulphides correspond with the number and equivalents of the oxyds of the respective metals, causing them to be more fluid and brittle when cold, and impairing their ductility when hot. Large quantities of sulphur cause a low degree of fusibility, which is shown in the sulphurets of antimony, lead, copper and iron, the fusibility in each decreasing more rapidly than the evaporation of sulphur. Iron pyrites melt at a low red heat; but when reduced to half their original quantity, by evaporating the sulphur, it requires a strong white heat to melt the sulphides. The presence of free oxygen is required for the removal of sulphur; nor can it be removed entirely when carbon, hydrogen or any other reducing agent is present, an oxydizing influence and thorough exposure of the metal to oxygen being necessary.

Nevertheless, the partial decomposition which certain metallic sulphides undergo when heated without the access of atmospheric air, is to the metallurgist a consideration of importance. Galena treated in this way suffers partial decomposition. So in like manner does the mono-sulphuret or mono-sulphide of copper, a sufficient amount of sulphur being evolved from it to yield disulphide of copper as the permanent fixed result. The higher sulphur combinations of iron, or chemically speaking, the sulphur salts of that metal, generated by the combination of two sulphurets or sulphides, also give a portion of their sulphur, when exposed to high heat in close vessels. Mono-sulphide of iron, however, does not yield up any of its oxygen by the mere process of heating in close vessels. The sulphide of zinc (zinc blende) is unchanged by the highest temperature. So in like manner is the sulphide of silver. The sulphides of gold and of platinum are decomposed when heated into sulphur and their respective metals. The sulphide of mercury can be distilled without change. Sulphide of antimony melts at a high red heat, afterwards distills over unchanged. The mono and ter-sulphide of arsenic (orpiment and realgar) both fuse and distill without undergoing any decomposition.

By far the more important and usual method, however, of effecting the reduction of metallic sulphides, consists in exposing them to the combined agency of heat and atmospheric air, constituting, in point of fact, the operation of roasting. Usually, the change which ensues during the operation of roasting, is the conversion of sulphur of the sulphide into sulphurous acid gas which escapes; the original sulphide either losing a part of its sulphur, and being thus reduced to the lower stage of sulphurization, or else losing the whole of its sulphur, oxygen is absorbed in place of the latter. Occasionally the sulphurous acid first generated absorbs the necessary amount of oxygen to change it into sulphuric acid, which, combining with the metallic oxyd simultaneously generated, gives rise to the sulphate of an oxyd. This latter is the case when galena (sulphide of lead) is roasted, the final result of the operation being oxyd of lead and sulphate of oxyd of lead. If the galena be argentiferous, the following reaction ensues. The mixture of oxyd of lead and sulphate of the same oxyd being heated to whiteness in contact with silver (of the argentiferous galena), oxydizes the silver by decomposition of the sulphuric acid, of the sulphate and oxyd of lead; hence there results a mixture of oxyd of silver and of lead—a mixture easily dealt with, and deoxydized by a subsequent operation. The sulphide and disulphide of copper are changed by roasting, into dioxyd of copper and sulphurous acid and sulphate of the oxyd of copper, which latter, when the temperature is raised to the highest pitch, evolves the whole of its sulphuric acid and oxygen; leaving metallic copper. Mono-sulphide of iron, by roasting, undergoes many progressive changes; beginning with the formation of protoxyd of iron and sulphurous acid, and ending in the development of sesqui oxyd of iron. Sulphide of silver is decomposed and yields metallic silver. Ter-sulphide of antimony changes under roasting into antimonious and antimonic acid. The sulphide and the sesqui-sulphide of arsenic are changed into arsenious and arsenic acids. By a modification of the same process, sulphide of nickel admits of decomposition into a mixture of oxyds and sesqui-oxyds of that metal. Sulphide of cobalt is also decomposed into a mixture of oxyd of that metal and sulphate of the oxyd. Finally, the sulphides of gold, platinum and mercury are also reduced to the metallic state, sulphurous acid gas being evolved.

Another element, equal in importance, requires the attention of the metallurgist. Chlorine has a tendency to induce metals to crystalize and causes, consequently, fluidity and brittleness. Chlorine removes all other matter from metals when the latter are in a state of fusion. Carbon, sulphur and phosphorous are drawn off by it, and if the heat is continued, the chlorine itself escapes with a portion of the metals, but only when a minute proportion is present; it is thus a powerful element in the purification of metals. Lead smelted from chloride is purer than from oxyds and sulphurets, and its proper application to smelting and refining purposes has a most beneficial influence. All metals smelted under the influence of chlorine, are inclined to oxydize, unless it is removed entirely. It is harmless to the metals, powerful as a means of fluxing slags and ores, and producing fluidity: its use, therefore, ought to be much more extended than it has been.

[The second line of the first paragraph in the second column of my last communication should read "must *not* be omitted," instead of "must be omitted."]

[To be continued.]

THE FUTURE OF THE UNITED STATES.—The Cleveland *Leader* has recently given its readers lengthy and labored statistical article on the prospective population and wealth of the United States. It shows (making all reasonable deductions) that by the year 1900 our population will be 102,000,000, and the aggregate of our wealth $100,000,000,000; that is to say, three times our present population, and over seven times our present wealth. It also shows that the population of New York, adopting a logical sliding scale of reckoning, substantiated by the past fifty years' ratio of increase, will in 1900 be 1,022,000. The average rate of increase of population in the United States from 1800 to 1860, was thirty-four and a half per cent. every ten years. Assuming that the rate of increase shall be but fifteen per cent. from the year 1900 to 1950, the *Leader* figures up a population of 207,248,138, for the 1950. If the *Leader's* showing is anything like correct (and we think it is,) the present public debt is a mere *bagatelle*.

A FRENCH IDEA OF WASHOE.—The Paris correspondent of the *N. Y. Times*, in a recent letter, makes the following statement in reference to the interest felt in France on the subject of the great mineral wealth of Nevada:

The *Moniteur* publishes a statistical history of Nevada, and admits that the birth of this new State is one of the wonders of the world. With the great want which is felt in France for the precious metals (for independently of the circulating medium, there is no country where so much metal is consumed in manufactures), it is not strange that the French should feel a certain jealousy in seeing all the important mines in the world in other hands than their own, or that they should watch with anxiety the development of the mineral resources of the great American mineral region.

SINKING OF A MOUNTAIN.—A Palermo journal of a late date says that a solitary mountain near Mount St Anastasi, in the district of Sieli, suddenly sank down to the level of the plain, a short time since, leaving no trace behind except a few trees which stood on its top, and are still partly visible. This strange phenomenon is attributed to the volcanic action of Mount Ætna, though the distance is considerable.

THE coasting trade of Chili was opened to vessels of every nation on the first of May. The immediate effect of this will be to increase trade with San Francisco, and benefit our commerce generally.

AN Illinois paper says that young Joe Smith is gathering a Mormon settlement at Nauvoo, the place in Illinois from which the sect were expelled with violence and bloodshed before they located themselves in Utah.

A RAID.—Wednesday night the workmen engaged in the Bajazet mine, Virginia City, made a raid on those at work in a portion of the Potsi mine, drove them out, and barricaded themselves. The raiders were armed.

PHOSPHORUS AND CIVILIZATION.—Consider for a moment: every adult human being requires at least four pounds of phosphates to build up his bony frame work, quite apart from the quantities used up in his softer parts. This amount is sequestrated from the earth, and never returns to it. Yet the earth, without phosphates, refuses to grow plants. Think of the millions upon millions of pounds which are drawn away from the primitive stock, and you will understand why vast stretches of Asia Minor are barren, why parts of Sicily, Palestine, Arabia Felix (once so fertile), and the plains of Babylon are deserts. These lands have been robbed of their phosphates. If Egypt still retains her ancient fertility, it is because the annual inundation of the Nile renews the precious phosphates. Did the barbarians always conquer because they were ignorant? No; because they were strong. They were truly the "sons of the soil," and of a soil not robbed of its phosphates, like the soil of the old and crowded nations. The civilized Roman trembled at the presence of the gigantic Gaul; but the descendant of that Gaul is so little of a giant that he now boasts of his stature when he is five feet six! It was remarked by Pliny that the Romans were rapidly degenerating in stature, and that sons were rarely so tall as their fathers; but he attributed this degeneration to the exhaustion of the vital sap, not knowing that a Liebig would come to proclaim the exhaustion of precious phosphorus.—*Cornhill Magazine.*

HOW NEAR WE ARE TO DEATH.—When we walk near powerful machinery, we know that one single misstep, and those mighty engines would tear us to ribbons with their flying wheels, or grind us to powder in their ponderous jaws. So, when we are thundering across the land on a railway, and there is nothing but a half-inch flange iron to hold us upon the track. So, when we are at sea in a ship, and there is nothing but the thickness of a plank between us and eternity. We imagine, then, that we see how close we are to the edge of the precipice. But we do not see it. Whether on sea or land, the partition which divides us from eternity is something thinner than oak plank or half an inch of flange iron. The machinery of life and death is within us. The tissues that hold these beating powers in their place are often not thicker than a sheet of paper, and if that thin partition were pierced or ruptured it would be just the same with us. Death is inseparably bound up with life in the very structure of our bodies. Struggle as we will to widen the space, no man can at any time go further from death than the thickness of a sheet of paper.

Let it be Known.—When any of our readers respond (by letters of inquiry or by the purchase of articles) to advertisements found in our columns, they will confer a favor, not only upon us, but upon the advertiser, by mentioning the fact of having seen the notice in our paper

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinklied.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-4y

Astonishing Illegality of Mining Advertising!

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were from d,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unnecessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

ADVICES from the mines in the vicinity of the Colorado river report a great scarcity of provisions in that region.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal Railroad and Financial Advertiser, New York.*

NOW IN ITS TENTH VOLUME
—THE—
Mining and Scientific Press,
—THE MOST—
Profitable Newspaper
—FOR THE—
Readers of the Pacific Coast.
Issued Every Saturday Morning.
DEWEY & CO., Publishers.

Our Journal enters its TENTH VOLUME with marked prosperity and improved facilities and resources for furnishing a handsome, valuable and well filled sheet.

We believe that the Press furnishes more information of ready application and intrinsic value to its readers than any other journal on this side of the Continent. Its circulation has doubled during the past year, and, for the economy and interests of the industrial classes of this and neighboring States, its subscription list should be more than trebled for the ensuing twelve months.

We shall continue to make the MINING AND SCIENTIFIC PRESS substantially

An Instructor to Prospectors,
An Economist to Millmen,
An Assistant to Active Miners,
An Economizer for Mining Advertisers,
A Reliable Reporter for Shareholders,
A Faithful Monitor for Stockdealers,
An Intelligencer for Mechanics,
An Incentive to Inventors,
A Reflector for Patentees,
And a Helpmeet to All Industrial Classes

Upon the Pacific Coast. We shall give accurate and frequent illustrations of new machinery and inventions.

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

☞ BOUND VOLUMES FOR SALE. ☜

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... $5.00

DEWEY & CO., Publishers.

C. W. M. SMITH.....W. D. EWER .....A. T. DEWEY.

CRYSTALLIZED THOUGHT.—The mind is not like the sea, whose riches cannot be exhausted, but rather a dark cavern in which stalactites slowly form. When man has brought out the last of these, then is the time for him to leave off. It is a great pity if he goes on honestly thinking that he is still producing stalactites, while his friends see that it is only rough pieces of stone plucked with some violence from the walls of the cavern. His friends ought to tell him of it, and he ought to stop, and in due time, other crystals may form as perfect and as beautiful as any that he has already found, and that without any conscious effort for it. Or if not, then he had better remain forever quiet, rather than weary himself and others also with these same rough fragments from the rock.—*Boston Review.*

HEAVY ROLLING WORKS.—The Phœnix Iron Works, Philadelphia, have a heavy contract from the United States to furnish iron for iron-clad steamers. They roll eight-inch square and twenty-four long, weighing about two tons and a half, of the best iron. The like of this has never been done in this country. Each piece is perfectly straight, square and smooth. Heretofore the Government had its heavy iron forged. These works are in complete order for this kind of work; the gearing and fixings are admirable.

A CURIOSITY.—Mr. H. D. McCobb has presented to the museum of Santa Clara College, a small section taken from the heart of a redwood tree, containing a sound and perfect acorn, firmly imbedded in the solid wood. The tree was cut about two weeks ago, in the hills fifteen miles southwest of Santa Clara, and was eight feet in diameter and three hundred and forty-eight feet high. The acorn must have been lodged in the tree not much less than a thousand years ago.

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with Illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras: and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

☞ That it may be within the reach of everybody, the price has been reduced to FIVE DOLLARS

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyritous, and the so called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

MANUFACTURES IN WASHOE.—The *Enterprise*, speaking of the progress of home manufactures in Washoe, says: For some time we have been manufacturing our own boilers and many other kinds of machinery used in the country, such as quartz screens, etc., and have even constructed steam engines; but until lately most of the tin ware used in the State has been manufactured in California. Now, however, a full supply for the whole trade will be manufactured in this city, at the establishment of Gillig, Mott & Co. They can make ware of this kind at prices so much below what the same goods can be had for and brought over the mountains, that no country dealer will think of purchasing in California. We saw a large lot of ware shipped from their store, and they have but just commenced the business.

THE Dubuque *Times* states that lead mining is receiving a new impetus in that section. There is a smelting establishment and shot tower established there, and several new companies are now at work with more capital, and more system and science, than have heretofore characterized the business, turning out lead to all shapes for commerce and for use. The lead region, it is estimated, is capable of furnishing our country with the $2,000,000 value of lead which is now annually imported from Spain and England and paid for with American gold.

THE Leon Consolidated is the name of a new mining incorporation in Virginia City. Capital stock, $450,000.

UNASSESSABLE.

First National PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known as "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. L. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

CONDENSING MILK.—This process is carried on at a factory in the State of New York, with advantage to all concerned, for in the solid form the milk will keep for a long time, and can be sent to all parts of the country. The condensation is effected by placing the milk in pails in a water-bath heated to one hundred and ninety or one hundred and ninety-five degrees; then pouring it into a "steam-well," in which it is boiled; then lifting it into the condensers, where it is again boiled, but in vacue, till but one-fourth of the original charge remains; then follows a final process of superheating, which has the effect of discharging a fetid, sickening odor from the milk. It is then ready for cutting up and packing, and is sold at thirty-two cents a quart. It is a curious fact that, although only four quarts are condensed to one, when pure water is added to reduce the article again to liquid milk, it is invariably found that it requires four quarts of water, and that the milk is then better than pure milk as drawn from the cow.

THE cheapest and best food is corn meal. It can be cooked in various ways, and is always palatable and healthy. Let corn bread, Indian meal cakes, corn pudding, fried mush, hominy, etc., be among the chief articles on your table, and dyspepsia will be unknown, while, at the same time, the cost of living will be less than when wheat flour forms the staple article of diet.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT.

17v10 28 Second street, San Francisco.

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine	No.	Fine
Assay.....250	913	Assay 300	980
Assay.....285	941	Assay for Chatman	980
Assay.....286	940	Assay Water Rock	966
Assay.....291	950	Assay Water Rock	993
Assay.....	.....St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAKELEE,
O. GORI, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

6th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

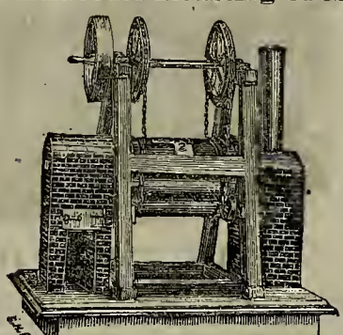
19v9

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard



Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analyses of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. (Illustrated in the Mining and Scientific Press, April 9th, 864.)

HEPBURN & PETERSON.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

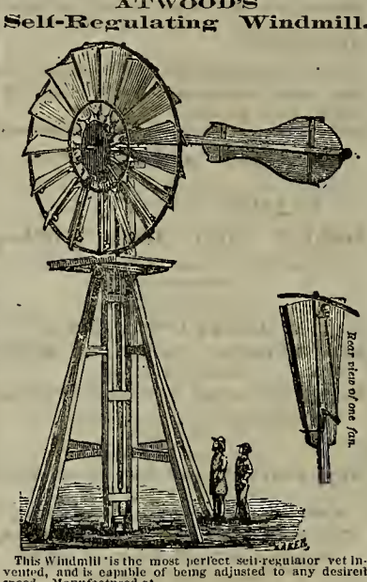
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

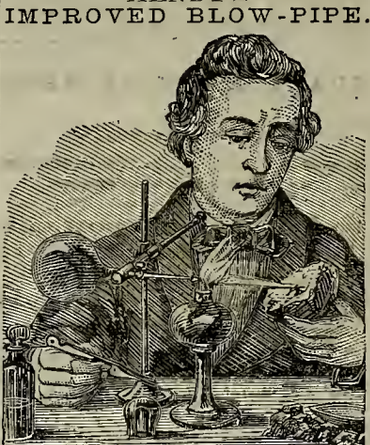
No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,



SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

—TO THE—

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the more contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

CALL AND EXAMINE SAMPLES.

DEWEY & CO.,

16v10-tf No 505 Clay street, San Francisco.

ANTIQUITY OF THE ORGAN.—This instrument is of so great antiquity that neither the time nor the place of its invention, nor the name of its inventor, is identified: but that it was used by the Greeks and from them borrowed by the Romans, is generally allowed. St. Jerome describes one that could be heard a mile off; and says that there was an organ at Jerusalem which could be heard at the Mount of Olives. Organs are said to have been first introduced into France in the reign of Louis I, A. D. 815, and the construction and use of them taught by an Italian priest, who learned the art at Constantinople. By some, however, the introduction of them into that country is carried as far back as Charlemagne, and by others still farther. The earliest mention of an organ in the northern histories, is in the annals of the year 757, when the Emperor Constantine sent to Pepin of France, among other rich presents, a musical machine, which the French writers describe to have been composed of pipes and large tubes of tin, and to have imitated sometimes the roaring of thunder, and at others the warbling of a flute. One writer alleges that organs were first used in churches about 600; another, that they were not used till after the time of Thomas Aquinas, about A. D. 1250. Gervas the monk of Canterbury, who flourished about the year 1200, says they were in use about a hundred years before his time. If his authority be good it would countenance a general opinion, that organs were common in the churches of Italy, Germany and England, about the tenth century.—*Chr. Reg.*

New Mining Advertisements.

Office, 31 Exchange Building, San Francisco. my20

Mosquito Quartz Mining Company, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of May, 1865, an assessment of five dollars per share (one dollar per foot) was levied upon the capital stock of said Company, payable on the 16th day of May, 1865, in United States gold coin, to the Secretary, at the Office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 17th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Friday, the 7th day of July, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.

By order of the Board of Trustees.

G. PARDOW, Secretary.

Office, No. 15 Montgomery Block, San Francisco. my20

Porter Gold and Silver Mining Company, Virginia District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 10th day of May, 1865, an assessment of five ($5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 534 Clay street, San Francisco, Cal.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 1st day of July, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. W. WESTON, Secretary.

Office, 534 Clay street, San Francisco.

San Francisco, May 13th, 1865. my20

Office Providence Gold and Silver Mining Company.—The Annual Meeting of the stockholders of the above named Company, for the purpose of electing Trustees and transacting other necessary business, will be held at the office of the Company, Nos. 7 and 10 Government House, corner of Sansome and Washington streets, San Francisco, on the 20th day of June, 1865, at 2 o'clock P. M. of that day. Q. A. CHACE, President.

J. M. BUFFINGTON, Secretary.

San Francisco, May 20, 1865. my20-td

NOTICE.

A Meeting of the stockholders of the Rough & Ready Gold and Copper Mining Company, Rough & Ready District, Nevada county, Cal., will be held on Monday, May 15th, 1865, at the office of the Secretary. Proxies must be filed. By order of the Board of Trustees.

C. W. M. SMITH, Secretary.

San Francisco, April 29, 1865. apr29

POSTPONEMENT.—The above meeting is postponed to Wednesday, June 7, 1865. By order of the Board of Trustees.

my20 C. W. M. SMITH, Secretary.

Salamander Gold and Silver Mining Company, Mill Valley District, Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of April, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, stiles, material and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 20, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

THE TRUE LIFE.—The mere lapse of years is not life. To eat and drink, and sleep; to pace around in the mill of habit, and turn the wheel of wealth to make reason our book-keeper, and turn thought into an implement of trade—this is not life In all this but a poor fraction of the consciousness of humanity is awakened and the santities still slumber which make it most worth while to live. Knowledge, truth, love, beauty, goodness, faith, alone can give vitality to the mechanism of existenee: the laugh of mirth which vibrates through the heart; the tears that freshen the dry waste within; the music that brings childhood back; the prayer that calls the future near; the doubt which makes us meditate; the death which startles us with misery; the hardship that forces us to struggle; the anxiety that ends in trust, are the true nourishment of our natural being.

THE Grass Valley *Union* says: A gentleman well posted in such matters, informs us that at this season of the year the apple trees in this vicinity are invested with white bugs, which knaw into their most vital parts, and if not driven off, succeed in killing the trees. He says the following recipe will be found very efficacious in ridding the trees of these vermin. Saturate a piece of flannel with coal oil and rub it on the trees. Those who own trees had better examine them, and if found buggy, apply the remedy above named.

THE San Jose *Mercury* of May 6th says the peach crop will be almost a total failure in that valley the present season, in consequence of the late spring frosts. We have examined some of the finest peach orchards in the valley that will not produce a baskct of peaches to the acre. The trees appear fresh and vigorous, but fruitless. Apples, pears, and the smaller fruits we shall have an abundance of—in fact, the prospect was never more promising.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

TO OWNERS OF MINES.

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.
2. Certificate of Notary that A. B. is Recorder of District.
3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.
4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10-1m No. 4 Cedar street, New York.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,

No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of those mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,

San Jose, California.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDIcial District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk.
By G. C. LECOUER, Deputy Clerk.

C Sims, Attorney for Plaintiff. 7v10-3m

Mining Notices--Continued.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of April, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 21st day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, 611 Clay street, San Francisco, my13

IRREPRESSIBLE—the famous hot springs on the Truckee, near Kay's station, after several premonitory explosions, upheavals of big gushes of hot water and steam, creating a great rumbling and shaking of the earth in the vicinity, on Thursday, the 9th inst., suddenly commenced spouting vast columns of boiling water which were thrown to the hight of fifteen or twenty feet, with a great roaring and escape of vast clouds of steam. The water thus spouted up formed quite a large stream, which poured down across the road passing near. These springs are scarcely second in interest and activity to the celebrated Steamboat Springs.

The School of Arts in Boston, connected with the Institute of Technology, will shortly organize a School of Mines, the object of which will be to educate young men for explorers and directors of metallurgical works.

By the 15th of June, probably at an earlier day, says the Placerville *Democrat*, the Placerville and Sacramento Valley Railroad will be completed to Shingle Springs, which is within eight miles of Placerville.

REMOVAL!

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND

COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all MINING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East

Parties owning Oil lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory

Best of references given.

☞ All business connected with Petroleum and Coal Mines will be promptly attended to. Address

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent, including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, which adds from one to three per cent more, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $200,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

March 2, 1865. 17v10-3m

ADDENDUM.

PER OVERLAND TELEGRAPH!

PHILADELPHIA, May 17, 1865.

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions ($230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency. JAY COOKE,
Subscription Agent, Philadelphia.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, at 622 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

DEWEY & CO., PUBLISHERS And Patent Solicitors. | SAN FRANCISCO, SATURDAY, MAY 27, 1865. | VOLUME X. Number 21.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. Higgins, Corresponding Secretary.

THE STOCK CIRCULAR.—The Stock Circular of the Associated Board of Brokers, of to-day's date, which will be found in its appropriate place, possesses unusual interest and importance. We would call especial attention to the prefactory remarks, as a matter well worthy the careful consideration of all. It is a matter of great importance, as there stated, that our mining corporations, the stock of which now occupies so large a space in the moneyed transaction of this city, and which is also seeking and extensively sharing the patronage of foreign capital, should be conducted honorably and honestly and with enlightened prudence and economy. The public security truly demands and should imperatively insist that such a policy should be observed.

RIX & LOGAN'S HAMMER QUARTZ MILL.—Next week we shall give a large and handsome illustration of this new invention upon our first page. The advertisement of the proprietors appears in the present issue.

GRINDING SURFACES.—There is probably no mechanical question of greater importance to the mining public of California than that involved in the different forms of grinding surfaces as applied to the reduction of quartz, after it has left the stamps or crushers. This question is fully and elaborately discussed in the "Quartz Operator's Hand Book," which is now in press at the book and job printing office of the MINING AND SCIENTIFIC PRESS. Messrs. Wheeler & Randall, the publishers of this valuable little work, have kindly allowed us the use of the proof sheets of so much of the same as relates to this interesting question. We give a portion of the discussion to-day, and shall continue the same through two or three subsequent numbers. It may be found somewhat dry to the general reader; but we are persuaded that it will possess much interest to engineers, draughtsmen and scientific readers generally. The work will be for sale within two or three weeks, of which due notice will be given.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Mansion Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

☞ New Mining and Miscellaneous Advertisements on page 333 ☜

MINING TITLES AND PETROLEUM LANDS.

Prior to the last session of Congress the Federal Government had by no word or act recognized any possessory or mining title to lands upon which mines exist, except by sufferance. But new light has recently been shed upon this subject, and such as enables us to determine with a great degree of accuracy the true *status* of actual possession under the local mining laws, and the consideration which such claims will receive in the Federal Courts.

During the last session of Congress, an act was passed organizing Federal Courts in Nevada. Among its provisions is one which, though brief and apparently insignificant, is still of the greatest importance, and which, if petroleum lands shall be dealt with as auriferous or other mineral lands, will be decisive of the validity of what is usually termed mining titles. The provision is as follows:

"*And be it further enacted*, That no possessory action in any of the courts of the United States for the recovery of any mining title, or for damages to any such title, shall be affected by the fact that the paramount title to the land on which such miners are is in the United States, but such case shall be adjudged by the law of possession."

By this provision Congress has explicitly recognized possession as sufficient evidence of title to protect the miner in his rights in the Federal Courts. He has long enjoyed that protection in the State courts. This act was framed with especial reference to the new State of Nevada; but will be held equally binding in all other States and Territories.

Since the promulgation of the above a new light has also dawned with regard to what will be recognized as "mineral lands" by the Federal Government. It is found in the subjoined extract from a letter of instruction from the Department of the Interior addressed to the Register of the Humboldt Land District. It reads as follows:

"It is not the policy of the Government to deal with petroleum tracts as ordinary public lands, any more than with auriferous or other mineral or saline lands. Hence, you will report the exact description of any and all tracts strictly of the character you mention, and will withhold the same from disposal by the Government unless otherwise specially instructed."

By the above it is distinctly set forth that possessing rights on "petroleum tracts," when held under local mining laws, will be viewed in the same light by the Government as possessors on auriferous or other mineral or saline lands. This instruction, it is true, comes only from a "Department" of the Government, but it has doubtless been issued with a pretty full knowledge of the general policy which has been marked out by recent Federal liquidation. We may soon look for a very lively movement in the direction of unsurveyed petroleum lands.

SMOKE WOUNDS.—A correspondent of the *Country Gentleman* mentions the case of a horse, which was just ready to die of an old festered wound. Fortunately, he adds, at this stage of the case, an old Pennsylvania teamster came to our relief, and recommended smoking with old shoes. A smoke was made of old shoes, soles and all, cut to pieces in a hog-trough, and placed under the swollen parts. In a few hours the swelling wholly subsided, and the wound commenced discharging matter. The horse was saved. Some years after this, I heard two persons talking about a horse which had been gored in the abdomen. In this case everything had been tried in vain. The poor creature must die. At my suggestion he was smoked, and when I next heard from him the old horse was well. So much for old wounds. In the same year, I cut my foot with an axe. The lady of the house, seizing the foot while it was yet bleeding freely, held it over a pan containing smoking tag locks. In a few minutes the bleeding stopped, and the smoke was removed, and a bandage applied to protect it from accidental blows. The wound never matterated, and consequently never pained me. I have seen this remedy tried in many similar cases, and always with the same results. Let the reader bear in mind that no liniment or salve drawing or healing, should be applied. You have merely to smoke the wound well, and nature will do the rest. I suppose the smoke of burning wood would produce the same results, but it would not be so manageable. There is a principle in the smoke of wood, which, when applied to the flesh, coagulates the albumen, thus rendering it unsusceptible of putrefaction. The same principle stops bleeding by coagulating the blood. It promotes healing, and may be applied with decided benefit to almost all ulcers, wounds, and cutaneous diseases.

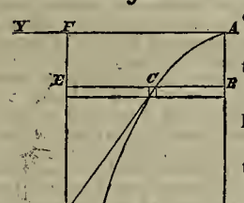
ANATOMY OF THE KLAMATH INDIANS.—The Klamath *News* says the Klamath Indians are an entirely different race of Indians from adjoining tribes. This difference is essential and strongly marked, and hence we apply at the head of this article the word Indian instead of "Digger." In physical formation as well as mentally, they are intimately the superior of all the Indian tribes we have ever come in connection with in this State, and we have known and observed many during a residence of eleven years in California. When we speak of Klamath Indians we mean to include all the tribes along the Klamath river and inclusive of what are known as Hoopas. In physical development they are scarcely inferior as a people to the whites. Daily you may see Indians passing back and forth at Orleans Bar, who would answer as models for fine manly conformation. Intellectually they are far in advance of any Indians we have heard of on the Pacific Coast. They are shrewd and cunning, and it is only necessary to have dealings with them to convince the most incredulous on this point.

From the QUARTZ OPERATOR'S HAND BOOK, by Wheeler & Randal—in press.]

DISCUSSION OF THE TRACTORY AND DIFFERENTLY FORMED GRINDING PLATES.

The discovery of the *Tractory Curve* was long attributed to Huygens, an eminent mathematician of the seventeenth century. That the curve, however, was known long prior to the discovery of Huygens, is proven by recent excavations in the ruins of Pompeii, where has been found a mill whose grinding surfaces are of tractory conoidal form.

What properties of the curve Huygens may have investigated does not appear. D'Alembert says that the evolute of the curve is the common catenary. Dr. Peacock says that the *Tractory* is an inverted semi-cycloid. As the term cycloid here used is not qualified, it must be inferred that the common is meant. Now, D'Alembert and Dr. Peacock cannot both be right; for the involute of the common cycloid is similar and equal to the evolute, that is, the cycloid itself. But the cycloid is essentially dissimilar and unequal to the catenary. Therefore, the cycloid and the involute of the catenary cannot both coincide with, or be the *Tractory*.



Again, as the equations of the *Tractory*, *Catenary* and *cycloid*, are essentially different, it is evident that neither D'Alembert, nor Dr. Peacock has correctly demonstrated and set forth the properties of the *Ttractory*.

The discrepancy of the above named authors, and the unsatisfactory and unreliable manner of laying down the curve mechanically, as adopted by C. Schiele, of Oldham, have led to the following discussion, the correctness of the result of which is not only certified to by several distinguished mathematicians, but is farther confirmed by numerous and carefully made experiments.

A tractory is defined to be "A curve whose tangent is always equal to a given line."

The directrix of the tractory here investigated is parallel with one of the axes, and the point of origin of the curve is in a line at right angles to the directrix.

Fig. 1.

Let A Fig. 1 be the point of origin.

Lay off on the axis AY the constant tangent AF$=a$.

Draw the directrix FD' parallel with the axis AX.

Draw CD$=a$ tangent to the curve ACC' at the point C

Produce BC in a right line intersecting FD in E.

Let x and y be co-ordinates of the curve at any point C, and let z denote the length of the curve AC.

Then $CE=BE-BC=a-y$, and $ED=(\overline{CD}^2-\overline{CE}^2)^{\frac{1}{2}}$

$$=(2ay-y^2)^{\frac{1}{2}}.$$

1. By similar triangles $dx=\frac{(2ay-y^2)^{\frac{1}{2}}}{a-y}dy$

2. By similar triangles $dz=\frac{ady}{a-y}$

1_1. Putting $u=(2ay-y^2)^{\frac{1}{2}}$

2_1. Squaring Eq. 1_1, $u^2=2ay-y^2$

3_1. Differentiating Eq. 2_1, $2udu=2ady-2ydy$

4_1. Dividing Eq. 3_1 by $2(a-y)$ $dy=\frac{udu}{a-y}$

5_1. Transposing Eq. 2_1, $y^2-2ay=-u^2$

6_1. Completing square to Eq. 5_1, $y^2-2ay+a^2=a^2-u^2$

7_1. Extracting sq. root Eq. 6_1, $y-a=\pm\sqrt{(a^2-u^2)}$

8_1. Or, $a-y=\pm\sqrt{(a^2-u^2)}$

3. Transposing Eq. 7_1, $y=a\pm\sqrt{(a^2-u^2)}$

9_1. Substituting value of $(a-y)$ Eq. 8_1, in Eq. 4_1,

$$dy=\frac{udu}{\pm\sqrt{(a^2-u^2)}}$$

4. Substituting values of $\sqrt{(2ay-y^2)}$ Eq. 1_1, $(a-y)$ Eq. 8_1, and dy Eq. 4_1, in Eq. 1,

$$dx=\frac{u^2du}{a^2-u^2}$$

5. Integrating Eq. 4, $x=\int\frac{u^2du}{a^2-u^2}$

1_2. By division $\frac{u^2}{a^2-u^2}=-1+\frac{a^2}{a^2-u^2}$

2_2. Decomposing $\frac{a^2}{a^2-u^2}=\frac{A}{a-u}+\frac{B}{a+u}$

3_2. Reducing to common denominator

$$\frac{a^2}{a^2-u^2}=\frac{Aa+Au+Ba-Bu}{a^2-u^2}$$

4_2. Clearing Eq. 3_2 of fractions

$$a^2=(A+B)a+(A-B)u$$

5_2. Transposing Eq. 4_2 $0=(A+B)a+(A-B)u-a^2$

6_2. Eq. 4_2 being true for all values of u, is true when $u=0$; hence $A-B=0$;

7_2. And $A+B=a$

8_2. Adding Eqs. 6_2 and 7_2; and dividing by 2, $A=\frac{a}{2}$

9_2. Subtracting Eq. 6_2 from Eq. 7_2; dividing by 2, $B=\frac{a}{2}$

10_2. Substituting values of A and B

in Eq. 2_2 $\frac{a^2}{a_2-u_2}=\frac{a}{2(a-u)}+\frac{a}{2(a+u)}$

11_2. Substituting value of

$\frac{a^2}{a^2-u^2}$ in Eq. 1_2 $\frac{u^2}{a^2-u^2}=-1+\frac{a}{2(a-u)}+\frac{a}{2(a+u)}$

6. Substituting value of

$\frac{u^2}{a^2-u^2}$ in Eq. 5; $x=\int-du+\int\frac{adu}{2(a-u)}+\int\frac{adu}{2(a+u)}$

$$=-u-\frac{a}{2}l(a-u)+\frac{a}{2}l(a+u)+C_1$$

When $x=0$; $u=0$ also $C=0$;

7. hence, $x=-u-\frac{a}{2}l(a-u)+\frac{a}{2}l(a+u)$

8. which may be rendered $x=-u+\frac{a}{2}l\left(\frac{a+u}{a-u}\right)$

9. Integrating Eq. 2, $z=\int\frac{ady}{a-y}=-al(a-y)+C$

When $y=0$, $z=0$ and $C=al a$

10. hence, $z=al a-al(a-y)$

11. which may be rendered $z=al\left(\frac{a}{a-y}\right)$

l, in the above calculations denotes the Naperian logarithm.

TO FIND THE AREA OF THE MERIDIAN PLANE COINCIDING WITH THE AXIS OF REVOLUTION OF THE TRACTORY CONOID.

$(b)_0$. Differential Equation, $d(\text{area})=ydx$

$(b)_1$. Substituting value (dx) Eq. 1; $ydx=\sqrt{(2ay-y^2)}dy$

$(b)_2$. Putting $y=a-n$; $ydx=-\sqrt{(a^2-n^2)}dn$

$(b)_3$. Decomposing and integrating,

$$\int ydx=-\int a^2(a^2-n^2)^{-\frac{1}{2}}dn+\int n^2(a^2-n^2)^{-\frac{1}{2}}dn$$

$(b)_4$. Second term of Eq. $(b)_3$;

$$\int n^2(a^2-n^2)^{-\frac{1}{2}}dn=-n\sqrt{(a^2-n^2)}+\int dn\sqrt{(a^2-n^2)}$$

$(b)_5$. Substituting in Eq. $(b)^3$, $-\int(a^2-n^2)^{-\frac{1}{2}}dn=$

$$-\int a^2(a^2-n^2)^{-\frac{1}{2}}dn-n(a^2-n^2)^{\frac{1}{2}}+\int(a^2-n^2)^{\frac{1}{2}}dn$$

$(b)_6$. Transposing,

$$-\int(a^2-n^2)^{-\frac{1}{2}}dn=\frac{a^2}{2}\int\frac{-dn}{\sqrt{(a^2-n^2)}}-\frac{n}{2}\sqrt{(a^2-n^2)}$$

$(b)_7$. But, $\frac{a^2}{2}\int\frac{-dn}{\sqrt{(a^2-n^2)}}=\frac{a^2}{2}cos^{-1}\left(\frac{n}{a}\right)$

$(b)_8$. Hence,

$$-\int(a^2-n^2)^{\frac{1}{2}}dn=\frac{a^2}{2}cos^{-1}\left(\frac{n}{a}\right)-\frac{n}{2}\sqrt{(a^2-n^2)}+C$$

$(b)_9$. Restoring value of n, $\int\sqrt{(2ay-y^2)}dy=$

$$\frac{a^2}{2}cos^{-1}\left(\frac{a-y}{a}\right)-\frac{a-y}{2}\sqrt{(2ay-y^2)}+C$$

Making $y=0$; Then $C=0$.

$(b)_{10}$. Hence, $\int\sqrt{(2ay-y^2)}dy=$

$$\frac{a^2}{2}cos^{-1}\left(\frac{a-y}{a}\right)-\frac{a-y}{a}\sqrt{(2ay-y^2)}$$

$(b)_{11}$. Making $y=a$. Area $=\frac{a^2cos^{-1}}{2}(0)=\frac{a^2\times2\pi}{2\times4}=\frac{a^2\pi}{4}$

$(b)_{12}$. Making $y=2a$. Area $=\frac{a^2}{2}cos^{-1}(-1)=\frac{a^2}{2}\times\frac{3\pi}{2}=\frac{a^2\pi}{2}$

Making $y=\frac{4a}{10}$, as adopted in one of the inventions of Wheeler & Randall, viz: in their grinder and amalgamator having the greater base of its muller upward. Making $a=1$, or unity.

Area $=\frac{1}{2}cos^{-1}(,6)-\frac{6}{2}(,8)=,2232$ half plane of muller.

Hence, area $=,4464$ entire plane of muller.

TO FIND THE SURFACE OF REVOLUTION OF THE TRACTORY CONOID.

$(c)_1$. Differential Equation, $d(\text{surface})=(a-y)dz$

$(c)_2$. Substituting value of dz Eq. 2, $ds=2\pi ady$

$(c)_3$. Integrating $s=2\pi ay$

$(c)_4$. Making $y=a$ $s=2\pi a^2$

Making $y=,4$, as adopted in that grinder and amalgamator of Wheeler & Randall, having its quarter base upward.

$(c)_5$. Surface of revolution $=s=2,5028$

TO FIND THE SOLID CONTENTS OF THE TRACTORY CONOID.

e_1. Differential Equation, d (solid contents)$=\pi(a-y)^2dx$

e_2. Substituting val. dx. eq. 1,

$$dC_0=\pi(a-y)\sqrt{(2ay-y^2)}dy$$

e_3. Put $a-y=n$ then $y=a-n$

e_4. $dC_0=-\pi a\sqrt{(a^2-n^2)}dn$

e_5. Put $s=a^2-n^2$, then $ds=-2ndn$, and $\frac{ds}{2}=-ndn$

e_6. Substituting in Eq. e_4 $dC_0=\frac{\pi s^{\frac{1}{2}}ds}{2}$

e_7. Integrating Eq. e_6 $C_0=\frac{\pi s^{\frac{3}{2}}}{3}$

e_8. Restoring (a^2-n^2) for s, $C_0=\frac{\pi(a^2-n^2)^{\frac{3}{2}}}{3}$

e_9. Restoring $(a-y)$ for n $C_0=\frac{\pi(2ay-y^2)^{\frac{3}{2}}}{3}$

e_{10}. Making $y=a$ $C_0=\frac{\pi a^3}{3}$

e_{11}. Making $y=\frac{4a}{10}=,4$ when $a=$unity $C_0=,5362$

The following table is computed by making the tangent $a=1$, and assiguing different values to u, not greater than a as shown in column marked u. That is, these values are substituted in equations 8, 3 and 11, and the co-ordinate values of x and y, and the length of the tractory curve z, thus determined in terms of the tangent or unity:

TRACTORY TABLE.

	$a=1$								
No	u	x	y	z	No	u	x	y	z

[Written for the Mining and Scientific Press.]

THE GEYSER SPRINGS OF CALIFORNIA.

Among the many natural wonders that physically distinguishe California from her sister States, the most astounding and interesting are the celebrated "Geyser" boiling springs, in Sonoma county, ninety-four miles north of the city of San Francisco. They were first discovered in 1847 by a hunter named Elliot, while bear hunting in the St. Helena mountains. He was a representative of those early pioneers, so graphically portrayed by the masterly pen of Cooper in his delineations of Leather Stocking and kindred trappers and hunters. Strange indeed must have been Elliot's sensations as, solitary, he in wonder gazed on the clouds of steam that, roaring and shrieking, upheaved in spinal columns from immeasurable apertures, at times veiling from sight the sides of the mountain. Elliot, like a true hunter, was a denizen of the forests, and avoided the encroachment of civilization, which had become distasteful to his habits. He ultimately fell in a fight with the Indians in Washoe.

Since Elliot's time, civilization has made her pathways through the mountains, and a commodious hotel has been erected opposite the principal Geyser Cañon, which annually increases in patronage of visitors and travelers, either indulging in scientific pursuits or health and pleasure, and the visitor's book enumerates, autographically, a host of clergymen, representing every religious doctrine of the caucasian race, also those who have adopted the lay professions, inclusive of science and all shades of politics. Several of these gentlemen having published their impressions of these wonderful natural curiosities. We prefer, in portions of this article, to give the thoughts entertained by writers so well known as Bayard Taylor, Capt. Davidson, of the U. S. Coast Survey, the Rev. Dr. Peck and others, rather than employ our own power of description of these veritable wonders.

One writer on visiting the Geyser Cañon, finding his power of adequate description to fail, writes: "I believe it was Fanny Kemble, who wrote in her book of Travels in America, Great God! who shall describe Niagara? and thereby gave a loftier conception of its unutterable grandeur than columns of details would convey.

The Geysers are reached from San Francisco, by the farming, grazing and vine cultured counties of Sonoma or Napa. By the former route we take the steamer for Petaluma, a flourishing little city, situated at the head of navigation, and arrive in five hours. Early next morning we pursue our route in comfortable stage coaches, or in any vehicle the traveler prefers, through the Petaluma valley, famous for its butter, cheese, and fruits of excellent quality, and abundant in quantity. As far as the eye can reach you see nothing but hay, and the air is fragrant with the pleasant odor of timothy and clover.

Sixteen miles north of Petaluma, through a valley, partly undulating, brings you to the county town, called Santa Rosa, which resembles many of the county towns in the most densely settled States on the Atlantic side of the Rocky Mountains. It is embowered within oak and similar noble trees, and some time can be pleasantly spent there in inspecting the various tastes displayed in adorning the pretty homesteads. A drive of sixteen miles northerly, on a road passing through fine natural parks, along the center of the Russian valley, with the hills about equally distant from either side, brings us to the town of Healdsburg, situated in the midst of a fine oak grove. There is not the sameness on these roads usual to valleys in California, as the ground is undulating, with patches of umbrageous forest trees, interspersed with indigenous vegetation and wild flowers of every hue. Elevated hills, some with a blue haze, from their distance, define the boundaries of this prolific valley, and afford fine pasture for thousands of cattle, when in other places the plains are parched. The Russian river valley is one of the most favored by nature and climate of the agricultural districts of this State.

Healdsburg is progressing in importance, and will be the terminus both of the Napa and Petaluma railroads, which will ultimately connect the northeastern counties of the State with San Francisco. From thence, a drive of eight miles brings us to Bays' station, situated at the foot of the St. Helena Mountains, within whose bosom the Geysers are situated. The drive of eight miles is by no means a smooth one in winter as the mountain streams render the track full of small gullies. These streams find their outlet in Russian river, which in summer is nearly dry; the limpid river threading its tranquil way through the center of a sandy and in some parts a pebbly bed, that in winter is greatly swollen by the melting snows from the mountains. Almost throughout the year the country teems with exuberant vegetable and animal life, grain, grass, vineyards, fruits, corn and cattle. The soil is rich, timber abundant, and climate genial. Bays' station is well supplied with horses and saddles, and at Healdsburg, four-horse stages convey visitors to the Geyser hotel. The station has a garden, orchard and fields of grain. The first four miles or less beyond the station to the summit of the first range of hills, is all ascension, nearly 1,700 feet in altitude being gained in that distance, or 2,258 feet above the level of the sea.

Even in California few places can vie with the magnificent view presented to the traveler from this ridge. Russian river valley is extended, map like, at your feet. The course of the river can be traced for miles far distant, alternately sweeping its great curves of rippling silver out into the opening plain or disappearing behind the dark masses of timber. From one end of the valley to the other, the golden yellow of the plain is diversified by the darker tints of various oaks and shade trees. In some places they stand in entangled masses and knolls, then an open space with a few scattered alders and laurels. Here and there, among the oaks, the vivid green foliage and the brightened stems of the graceful madrone can be seen, and on the banks of the river, the silvery willows and dusky sycamores. The beauty and verdancy of the plain is yet more enhanced by the widely extending fields of grain and corn, together with orchards of delicious fruits, and vineyards which have become a speciality of this and the adjacent counties.

Bayard Taylor, on reaching this ridge, says: "The high conical peak behind which lay the Geysers, and the lower slopes of which we were ascending, is known as Geyser Peak. Its summit is 3,471 feet above the sea, and is distinctly visible from the Bay of San Francisco. Eastward across an intervening valley rises the blue bulk of Mt. St. Helena, 5,000 feet high, while to the west and south, the valley of Russian river, which here makes an abrupt curve, spread wide before us—a dazzling picture of warmth, life and beauty, covered as with a misty violet bloom. Our road was shaded with pines and oaks, with an undergrowth of buckeye and manzanita. The splendid forms of the trees were projected with an indescribable effect against the yellow harvest which mantled the mountain sides. The *madrone*, elsewhere a shrub, here becomes a magnificent tree, constantly charming the eye with its trunk of bronze, its branches of copper, and its leaves of supernatural green. Ascending gradually for a mile and a half, we reached the top of the first terrace or abutment of the mountain chain. Here stood a shanty near a spring, and a herd of at least 400 sheep were gathered together under the immense spreading boughs of some evergreen oaks, but settlers and shepherds were absent. We now followed the top of the ridge for three or four miles by a broad and beautiful trail, marked with cart-wheels. A splendid breeze blew from the opposite hight, and the clumps of giant madrones and pines shielded us from the sun. As my wife and I sauntered lightly along, our eyes rested continually on the wonderful valley below. The landscape, collossal in its forms, seemed to be motionless, leagues deep, at the bottom of an ocean of blue air. The atmosphere, transparent as ever was palpable as glass from its depths of color. No object lost its distinctiveness, but became a part of an unattainable, though not unreal world. The same feeling was excited as when leaning over a boat in some crystal cove of the tropical sea, I have watched the delves and valleys of the coral forests. Across a deep hollow on our right, splendidly robed in forests, rose Geyser Peak, covered to the summit with purple *chemisal*. I am afraid to describe the effect of this scenery.

It was a beauty so exquisite, a harmony so complete, as to take away the effect of reality, and our enjoyment was of that supreme character which approaches to the sense of pain. Finally we descended into the hollow, which narrowed to an abrupt gorge, losing itself between steep mountain walls. Masses of black volcanic rock, among which grew titanic vines, gave the place a wild savage air; but the bottom of the gorge was a bower of beauty. An impetuous stream of crystal water plunged down it, overhung by a wilderness of maples, palm trees and deciduous oaks. Meanwhile we had been gradually regaining the summit of the ridge beyond the gorge, riding under broad-leaved oaks, which reminded me of the *Erymanthean* forests. Presently there opened a most unexpected picture. A circular meadow of green turf, the peak on our right, golden and purple to its summit, an oak knoll on the left, dotted with white tents, with picketed horses, men lying in the shade, and all the other picturesque accessories of a camp. It was the headquarters of Captain Davidson, of the Coast Survey, evidently a man of taste, as well as of science. The repose was tempting, specially to my wife, to whom rough mountain travel was a new thing. But we had no time to lose, for there were the Geysers before us. A mule trail engineered up the steep by lazy windings led us to a hight of 3,200 feet above the sea, whence the unknown regions behind Geyser Peak became visible, and we turned our backs on Russian river valley.

Build of the Ironclad "Modoc."

Editors Press:—On the 20th inst., Mr. I. S. Underhill launched from his ship-yard, at Greenpoint, L. I., the U. S. L. D. Monitor, Modoc. The Modoc is one of the five boats which Government concluded to change into torpedo boats, after the officials had found out the miscalculations as to the displacement of these Monitors. She is 225 feet long, 45 feet 1 inch wide and 9 feet 1 inch deep; the bilge of this boat is eight inches fuller than those of the other boats, her overhang is raised six inches more, which made her trim in the water very favorably; she was aft 18 inches, forward 22 inches and amidships 24 inches out of water; ready for service, her average hight above water will be about 14 inches, which compares favorably with the other boats of that class. The Chimo, built in Boston, is only seven inches, the Naubee and Casco are only ten inches out of water.

This vessel, of course, has the same weakness to which I referred in a former letter about the light-draft Monitors; but the contractor did all in his power to mitigate those inherent faults by using the best material and workmanship only; for which praise has been accorded her by every engineer who has had a chance to examine her.

Her engines were also built by Mr. I. S. Underhill, at his old establishment, in Tenth street, New York, the Dry Dock Iron Works, which lately passed into other hands. She has two cylinders 22 inches diameter, 30 inches stroke of piston; they are inclined, each cylinder driving a propellor. The starboard propellor is worked by the port engine and the port propellor is worked by the starboard engine. The boilers are beautiful pieces of workmanship, and when they were subjected to the customary cold water pressure, which in this case amounted to eighty pounds per square inch, there was hardly any leakage perceptible.

The accommodations for officers and crew are superior to those afforded by any other vessel of her class; her deck forward has a great deal of crown, thus giving a comparatively high and airy cabin, wardrobe and berthdeck below. There are eleven inches in her favor compared with any other vessel of her class. The crew consists of twelve officers and forty-two men. Her armament comprises besides one 11-inch gun, which moves on a wooden platform, forward of the pilot-house, chief engineer W. W. W. Wood's torpedo arrangement, which is attached to her bow.

The launch of the Modoc took place in the presence of a large and fashionable crowd, amongst whom there were a number of national and foreign naval officers. Miss Amanda Underhill, the handsome and accomplished daughter of the builder, christened the boat by breaking a bottle of champagne over her bow and speaking the following words:

"In the name of Neptune, I christen thee "Modoc;"
May you henceforth triumphant sail,
And forever over the enemy prevail."

The boat was commenced about eighteen months ago; her completion was delayed considerably through many alterations which Government made upon her. The draughtsman and superintendent of ship and machinery during their building was H. Heberlein.

Yours most respectfully, H. H.

New York, March 28th, 1865.

Remarks.—The above letter was received some thirty days after being due, probably owing to the *delectable* inefficiency of our Overland Mail system. There is no good reason why we should not have regular mail communication, with Chicago and St. Louis, with schedule time not to exceed sixteen days, and the sooner our people take some effective measures to wake the Government up to this fact the better.—Eds. Press.

[Written for the Mining and Scientific Press.]

The Oil and Mining Interests of Colusa.

Messrs. Editors:—I have noticed in your paper that you have several times mentioned the oil and mining interests of Colusa, and having recently returned from a tour through that county, I herewith furnish you with a few notes, which perhaps may be of interest to your oil-seeking readers. Leaving San Francisco, I did not see anything worth the attention of the oil-seeker until I reached the Butte mountains. When about half way through the "pass," I noticed the point of contact of the sandstone and primitive formation, and near which, and about half a mile to the north of the road, parties are engaged in boring for oil, with quite flattering prospects of success. This well is about a mile from Senator Parks' ranch, on which place I was told, by Mr. Parks himself, that the oil sometimes oozes out and runs into the creek in such quantities that the cattle will not drink the water.

Leaving the Buttes, we soon reached the town of Colusa. Traveling westward from thence about eighteen miles, we reached the eastern slope of the Coast Range, where I was impressed by the peculiar formation of the district, which is composed of parallel layers of sandstone from one to four feet thick, so tilted on their edges that they do not lack more than about ten degrees of being vertical. At noon I reached Lains' station, situated in a fertile little valley, about six miles from the main plain, and in company with Mr. Lain started out to make a few observations. Here I found a change in the formation; instead of the successive layers of sandstone, I found a formation of sand and shale slate, in alternate layers, varying in thickness from one to twenty feet, running north and south, and inclined to the east at an angle of seventy-five or eighty degrees.

Mr. Lain, who is a very intelligent man, showed me everything of interest which the limited time would permit. He has some fine property here; but like a great many others has the home fever, and wishes to sell out and go East. This ranch, of four sections of land, all under fence, can be bought for $5,000, and is worth all the money for a wayside station, to say nothing of the flattering prospect he has for oil. This formation continues for about eleven miles, or to within half a mile of Simmons' sulphur spring, where we find a serpentine formation. All along the road from Lains' station to Simmons' spring, there are numerous indications of oil; but on reaching Bear Valley, the indications increase, and oil and gas may be seen issuing from the rocks and fissures in quite a number of places along the roadside. I spent two days in my observations around Simmons' spring, and in that time visited probably forty different places where the petroleum oozes from the rocks. The one that presents the most flattering prospect is Capt. Rowe's well, in Sulphur Cañon, about half a mile from the sulphur spring, and about a quarter of a mile from the point of contact of the sandstone and slate formation with the serpentine before spoken of. Here the oil comes out of the rock, and is collected from the surface of the water with a feather in quite a pure state.

Capt. Rowe had machinery on the road, and before this, has commenced to solve the great problem of the existence of oil here in sufficient quantities to pay; and we shall hear before long with what result. There is certainly in this district the best surface show of oil I have yet seen; but the rocks still preserve their tilted position; saying which, I allow the reader to draw his own inference. All the land in this vicinity is taken up, and every man claiming a hundred and sixty acres of land is, in imagination, a millionaire.

The Simmons' sulphur spring is remarkable for its medicinal qualities, and considering the wonderful cures which it is said to have effected, it is to be regretted that it is not better known to the public. There has been some mining done in and about this vicinity for gold, copper and cinnabar; but to such a limited extent that it does not yet amount to much.

Miner.

Important.—The important discovery that South American dried or jerked beef can be imported to England and sold to the consumer for three cents per pound, has given John Bull a new sensation. No wonder; for in this thing we have one of the most important discoveries of the age, not only for the densely populated western nations of Europe, but to all the great seaboard cities of the United States, from Boston to New Orleans.

Women love to find in men a difficult combination—a gentleness which will almost invariably yield, with a force that will invariably protect.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, May 27, 1865.

Little or no change is perceptible in the condition of the money market, save that a further accumulation of capital may be noted, together with occasional concessions in the rates of interest to certain borrowers. Money is thought to be more plentiful than for some time past, and is likely to remain so for the present, but mining share collaterals are still out of favor with capitalists, and few or no facilities are extended to dealers.

Receipts of treasure from the interior, during the week, amounted to $900,000, making an aggregate of $4,100,000 since the 1st inst. Gold bars are selling at about 830, and silver is quotable at from ½ ₱ cent. premium to 2 ₱ cent. discount.

Legal Tender Notes were active, but very steadily maintained, in view of the large disbursements being made by the United States Quartermaster of this Department. $226,000 (par value) were dealt in, receding from 77½c to 76½c, advancing to 77½c again, then selling at 78¼c, and closing at 78c bid, 78¼c asked. Latest telegraphic advices from the East quote gold at about 132, which has been the prevailing rate for a week past.

The stock market has been characterized by considerable activity this week, but with scarce an exception nearly all shares have been sold at a decline. The short interest continues to attract the attention of many dealers, and seller's option contracts are being made with much freedom. The prospective demand for stock for future delivery growing out of these sales, imparts some strength to the market, but recent intelligence as to the actual condition of a number of claims is not deemed favorable, and in the absence of a speculative demand for a rise it will be difficult to enhance prices at present. It is also well known that the financial condition of certain companies is now and has been for two months past much less flattering than the public were led to believe, and that their net earnings for thirty or sixty days hence will be absolutely required to liquidate obligations incurred in the payment of dividends to stockholders. A different policy must prevail hereafter, or the public will have no confidence in the future management of these companies. Heavy losses have been sustained by many dealers, and they seem now fully conscious of the folly and insecurity of blindly entrusting their interests to the hands of others, whose incapacity, dishonesty or imprudence, unwatched or unguarded against, may at any time involve them in ruin. There has been, unquestionably, a radical defect in this business somewhere, and we may take it for granted that any board of trustees or directors that shuns the light of full and free investigation, and refuses to parties interested such disclosures as are necessary to a correct and proper understanding of the affairs of the corporation whose servants they are, deserve no confidence, and are actuated by sinister motives. It is of great importance that our mining companies, which have become so numerous and are absorbing so large a portion of the wealth of our citizens, and are likewise seeking and sharing the patronage of foreign capital, should be conducted honorably and honestly, and that every guard and check which enlightened prudence and experience call for should be thrown around those who are entrusted with their management. The public security demands this, and it should be insisted on henceforth.

Gould & Curry has again obtained the most prominent position on the list, and 48 feet were dealt in, receding from $1,660 to $1,575, seller 30, advancing to $1,690, declining to $1,540, and selling yesterday at $1,500@1,510. No change has taken place in the appearance of the upper level, and about the usual quantity of ore is being hoisted to the surface. A dividend of $50 per foot is likely to be declared for the current month.

Yellow Jacket steadily declined from $1,475, seller 30, and $1,550 cash, to $1,275 regular way, and closed yesterday at about $1,310. The west lode in the lower level, north of the shaft, is said to show some improvement, and the average product of the mine exceeds 200 tons of ore per day. We have good authority for stating that this company was considerably in arrears upon payment of its last dividend, and that its indebtedness at the present time amounts to more than $130,000.

Savage rose from $1,260 to $1,320, declined to $1,160, then sold at $1,260, and closed at $1,240; some 62 feet in all changing hands. From the North Potosi chimney and the east chamber of the first level some 80 tons of ore per day are now taken, averaging $33 per ton. The indebtedness of this company upon the payment of their May dividend exceeded $80,000, and at this time their liabilities amount to $100,000. This latter does not include obligations to be incurred in the completion of the new hoisting works.

Belcher rose from $1,070 to $1,100, receded to $1,000, and closed at $1,010. Some good ore is being taken from the second level, and a dividend is confidently anticipated for the month of May.

Crown Point fell from $900, buyer 30, to $760, seller 30, and sold yesterday at $770. At these rates 26 feet were dealt in. Alpha was sold at $925, but is now offered at $875.

Ophir advanced from $460 to $550, declined to $450, and sold yesterday at $500. Within this range 45 feet changed hands. The shaft is now down 560 feet, and several small veins of metal-bearing quartz were disclosed in sinking the last fifty feet. Have just commenced drifting from the eighth station, and will also soon commence drifting from the ninth station, at a depth of 600 feet. Within the past month the company have struck a body of rich ore in their north mine, between their first and second stations, and also in their south mine, between the sixth and seventh stations. In addition to this, south and west of any previous work, they have opened up a vein of rich ore, yielding from $130 to $135 per ton, and already seven feet wide.

Hale & Norcross fell from $460 to $450, rose to $480, and closed at $480. Empire Mill & Mining Company has met with no sale, but is well held at about $475 per share.

Potosi fell from $382 to $295, and closed at $266; within which range 267 feet were sold. Chollar declined from $375 to $305, and closed at about $270; some 120 feet changing hands. The indebtedness of the Potosi Company is believed to be $190,000, and that of the Chollar about $160,000, exclusive of the Grass Valley debt of $150,000, making an aggregate of $500,000 for the two companies. We learn of no new developments in either mine.

Imperial has been very actively dealt in, and 1,564 shares were sold, declining from $250 to $150, rallying to $185, receding to $157, and closing at about $166. From information derived at the office of this company, we ascertain as follows: The surplus balance from the March account carried forward to April was $26,590.36; the earnings in April were $47,795.94; making an aggregate of $74,386.30. The April expenses were $32,234.91, and the dividend was $40,000, making $72,234.91, and leaving a balance to May account of $2,151.39. The ore for that month averaged about $23 per ton, and the receipts for the the first 15 days of May were $15,538.64, and for the last half of this month are estimated at $35,000, and the expenses for the entire month at about $33,000. This would leave a balance on hand on the 1st of June of about $19,000. It is not probable that a dividend for May will be declared. When the last dividend was declared the prospects of the mine were very flattering, and it was supposed that not only $10 could be divided for May, but a surplus added. It was, however, found impossible to commence work in the lower level until the 9th inst., consequently the first part of the month receipts were from poor ore, out of the fourth gallery. The drift east is in 115 feet from the shaft; the last 22 feet in pay ore. The bottom of the main shaft is in good pay ore, at a depth of 600 feet from the surface—the deepest development on the Comstock lode.

Uncle Sam declined from $190 to $145, and was sold yesterday at $140. Minerva fell from $260 to $240 per foot, and Central was sold at $200 per foot.

Bullion fell from $165 to $130, rallied to $150, and closed at $135. Burning Moscow has been steady at from $46 to $44. Nevada (J. G.) declined from $39 to $25, and is now held at $25. Sierra Nevada fell from $18 to $16.

The aggregate sales of stocks and Legal Tender Notes, since Saturday last, amounted to $1,134,024.

Terms of Subscription:

One copy, per annum, in advance,.....$5 00
One copy, six months, in advance,..... 3 00
☞ For sale by Carriers and Newsdealers.☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, May 27, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Butte and Yuba counties.

Thos. Poyzer, of Grass Valley, for Nevada county.

A NEW MINING INVENTION.

The Virginia City papers are speaking very highly of a new mining invention, a model of which is now being exhibited in that city. It is the inveation of Col. John A. Collins, a gentleman who has had much experience in mining and mechaaical matters. It has been visited by a great number of engineers, mechanics and millmen, all of whom unite in pronouncing it a valuable inveition. It embraces both crushing and amalgamation. The *Enterprise* says that "its compactness of form, its simplicity of construction, its completeness of detail, its freedom from shafting, helting, pulleys, spur-wheels and bevel geariag, and its consequent exemption from derangement, its liberal promise of reduction in the price of a mill, great efficiency in labor, large saving of motive power and consequent cheapening of the price of reducing ores, failed aot to challenge the almost universal admiratiou of those who felt competent to express an opinion upon an inventiou, the complicity of which is only equalled hy its promise of efficiency. The inventor has a standing offer of ten dollars to any person who will suggest what shall prove upon trial, to be a practical defect in, or an improvement of his machine. but as yet visitors have not proffered their criticisms." We understand that Mr. Collins will soon visit this city with his model, with the view, we presume, of having one of the machines constructed and put in operation. When he does so we shall endeavor to give a full description of the same.

THE LATE RAINS have been of great benefit to the crops, and we are now almost certain of a good yield of cereals throughout nearly all the agricultural portions of the State. Some new mown grass in the valleys has been injured, but the mountain hay growers have been vastly benefitted. The speculators will be about the only class to regret this provident scattering of nature's greatest blessing. The drought which they had hoped for has gone of in fogs and clouds; and the huge profits which they had confidently counted upon has vanished in a mist. We may now look for a steady and continued decrease in the prices of breadstuffs and provisions. The rain appears to have extended from Stockton, where it was very light, quite to the northern extremity of the Sacramento valley, its main strength being expended in the neighborhood of Sacramento City. It did not effect either the Yuba or Feather rivers.

THE FOUNDRIES.

The number of orders for mining machinery received at the San Francisco foundries during the past ten days, though not equal to that for the same time a year since, shows a great improvement on last month. As the roads to the mountains begin to improve, the business will be likely to steadily increase. An important feature of the business this spring is the large number of fine mills that are building on orders from New York. Part of these are intended for Nevada, while a respectable number go to Oregon and the North.

At the PACIFIC IRON WORKS there is a considerable amount of steamboat work under way, including machinery for three propellors for the Alviso Transportation Company, and one side-wheel steamer for the river trade. Three quartz mills with the Keyes' battery, are in process of construction for parties on Kern river. Two more large mills are building on orders from the East, but we are not aware of their destination. Another mill also building at this place, is intended for Mr. Dall, of Washoe Valley.

At the VULCAN, the principal feature among the mining orders is a twenty-stamp mill for parties in Amador county. They are also building two engines for the Oregon Steam Navigation Company, each six feet stroke and eighteen and one-half inches in diameter of cylinder.

Nine quartz mills in all are building at the MINERS' FOUNDRY, mostly on Eastern orders, sent by telegraph, and the destination of which is unknown. Most of these mills are to be of large size. One engine of 120 horse-power, intended for driving a forty-stamp mill, with pans and appurtenances complete, but to be accompanied by only twenty stamps, is nearly finished, while four more of sixty horse-power with twenty-stamp mills are under way. In addition to this mill work, the proprietors of this foundry are building some very fine machinery for their own use, including one six and one eight foot lathe, which will greatly facilitate the finishing of heavy work.

A ten-stamp mill, with four Varney pans and two Prater's concentrators, is now nearly finished at the FULTON FOUNDRY for the Nevada S. M. Co., of Humboldt Co., Nevada. They have just completed a 15-stamp mill for the Victor G. & S. M. Co., of Idaho, with two of Moore's grinders. The orders for Prater's concentrators are quite numerous. A great deal of saw-mill work, hydraulic mining work, and a large number of pumps, &c., are also under way.

Devoe, Dinsmore & Co., of the SAN FRANCISCO FOUNDRY, are building a number of new mining machines, including Baux & Guiod's amalgamators, Rix & Logan's quartz-crushers, and the amalgamators and concentrator invented by Messrs. J. & W. C. Salmon. All of these machines promise well, though none of them have yet been very generally introduced. Besides these machines, they are doing considerable general work.

MR. GUIDO KUSTEL, in his work on "Nevada and California Processes of Gold and Silver Extraction," lately published in this city by A. Roman & Co., has given an excellent treatise on the metallurgy of the precious metals, as understood and practiced in this State. It is written with so much clearness that any miner can understand it, and with so much correctness and learning that it will be accepted as a standard work by professional metallurgists.

THE clergymen of Brooklyn, Long Island, appear to be favorites of fortune. It is reported that one of them has recently made $80,000 out of a little oil operation; while another, still more fortunate, has realized $250,000 from a recent investment of $5,000 in oil lands.

FISH.—There are said to be tons of fish in the low lands of Tulare county, carried thither by the late high water. Now that the water is gone their presence is anything but agreeable.

THE OWEN'S RIVER CANAL PROJECT.

The Owen's River Canal Co. have succeeded, through the exertions of the President, Mr. R. S. Whigham, now in New York, in arranging for the capital necessary for the prosecution of their enterprise, upon condition that the claims made in its behalf should be endorsed by a competent mining engineer. upon personal examination. Mr. Melville Attwood, Consulting Mining Engineer, of this city, having been designated for that duty, and duly notified, proceeded recently to the locality. We learn that a summary of his report may be stated in the following points:

1. The canal is feasible for the length surveyed.
2. The immediate construction of certain sections is recommended.
3. The erection of two mills is recommended for the development of the mines on the line of the canal. One of these might be most advantageously located at Chrysopolis and the other at San Carlos or Bend City.
4. The mines along the line of the projected canal are extensive and promising.
5. The construction of the canal and application of the water of Owen's river as a motive power must precede the profitable reduction of quartz in that region.

The Owen's River Canal enterprise is projected upon a basis of great utility to the locality it is designed to develop. It is proposed that the company shall furnish both water-power and milling facilities for the public. By this aid mining companies can make their property productive with but slight calls upon shareholders, and miners holding valuable claims will be independent of capitalists. They can develop their mines by their own labor, and will need no money to erect mills.

It is believed that a water-power mill, having the capacity to reduce twenty tons per day, or 5,000 tons per working year of 250 days, can be built for $30,000. A profit of six dollars per ton may be safely computed on this reduction. This would give a total of $30,000 on the annual work of a mill of the capacity stated, or 100 per cent. per annum on the cost. The amount of milling capital that might be eventually profitably employed would probably reach several millions.

The motive power to be supplied by the canal company can be also applied to saw-mills, grist-mills and machine shops.

The soil of the valley is fertile, capable of furnishing every kind of agricultural supplies. The surveyed land, most of which is tillable with the aid of irrigation, is estimated at 400,000 acres. The climate admits of the energetic prosecution of mining industry in all seasons of the year.

The canal enterprise is adapted to the rapid development of the most extensive and promising mining region on the Pacific coast. As such an instrumentality, California is greatly interested in its early completion.

The eminent rank of Mr. Attwood in his profession, his extensive experience and known careful investigation, give to capitalists concerned, the highest guarantee of the merits of an enterprise which obtains his endorsement.

OUR armies have captured seventeen hundred pieces of artillery from the rebels since the 1st of December last. The N. Y. *Herald* says: "The monumental column erected by the First Napoleon in the Place Vendome from the captured cannon of his sweeping Austrian campaigns is considered a grand affair; but in the presence of the column which these last five months' captures of General Grant would make, Napoleon's monument would dwindle down to the pitiful proportions of a Lombardy poplar under the shadow of one of those gigantic cloud-kissing cedars of California."

GROWING FISH.—The subject of the river fisheries in New England was discussed, lately, by Professer Agassiz before the Massachusetts Legislature. In the course of his remarks he said that in 1840 he began experiments in the artificial propagation of fish, and he believed he was the first person in the country who had done it. He did it for the sake of study. He used for an apparatus nothing but the wash basin in his bedroom, where he raised trout, white fish and a number of less valuable fish without taking much care.

A French workingman's breakfast costs him about two and a half cents; his dinner, including half a bottle of wine, ten cents; and his supper, about a cent and a quarter.

COMING BACK FROM IDAHO.—A large number of prospectors are now on their way back from Idaho. Many went there just as many foolish men have run after every new excitement, in California since 1850, expecting to pick up the gold and silver as they would stones in the street. Of course all such must be doomed to disappointment. It is a wise precaution of Providence that the precious metals can be attained only by hard and persevering labor. To all who are willing to make such an effort and pay such a cost, success is certain. But the lazy and dissolute, who are running hither and yon, expecting to make a fortune without effort, neither Idaho or any other region will prove an El Dorado. Idaho is probably no better than any other mineral region on the Pacific slope; but a reasonable reward is sure to attend upon the efforts of industry, wherever they may be properly and energetically applied throughout the extent of this western land. A rolling stone never gathers moss, and if a setting hen never grows fat, her incubation is not without its proper and full reward.

J. ROSS BROWNE AGAIN ON HIS TRAVELS.—We received a call from this talented writer and distinguished traveler on Monday last, on which day he took his departure, mountainward, for Virginia City and Reese River. He informed us that it was his intention to proceed directly to Austin, where he will stop long enough to take a thorough look at the Reese River mines; after which he will go northward into Idaho, for the purpose of giving the mines of that new and promising region a thorough examination. He will return to California *via* the Colorado river. Our mining friends on the route indicated will, of course, extend to their visitor every reasonable courtesy. His notes of travel will receive a wide circulation through *Harper's Magazine* and other periodicals with which he will correspond. The readers of the MINING AND SCIENTIFIC PRESS will hear from him occasionally during his trip, as he has promised to send us some account of the interesting mineral regions through which he will pass.

ARTESIAN WELLS SHOULD BE CAPPED.—The San Jose *Mercury* of 18th May says: We must carry a law through the next Legislature providing, by heavy penalty, against the damage to the country caused by the flowing of water from the artesian wells in this valley. The water thus suffered to flow to waste gathers in large streams in the lower portions of the valley, inundating and damaging much valuable land. But the effect upon the higher portions of the land is even more injurious. It is well understood that our soil is mostly light and porous, with no protecting sub stratum of hardpan or clay to hold the winter rains. Hence in a very short time after the heaviest fall of rain, the soil is leeched dry. Before the general introduction of the artesian auger, and the exhaustive process of draining now witnessed, the upward pressure of moisture from below kept the surface soil in the best possible condition for vegetation. But this condition of things has entirely changed, and if allowed to continue unchecked, our valley will soon be ruined for all purposes of agriculture. Not a bushel of grain can be produced. The flowing wells now in existence may be numbered by hundreds. It is estimated that about 200 new wells were bored during the last year. Something must be done, and that soon. Some wells are neatly capped, and the water only allowed to flow in such quantities as are required for use. All should be served in the same way. Capping is entirely practicable, and is attended with but little expense.

CHILDREN.—When a child is hurt, never hush it. It is inexcusable barbarity; it is repressing her instinct; and for this reason if physical punishment is inflicted on a child, it is perfect brutality. Cases are on record where children have been thrown into convulsions in their efforts to silence. A thousand times better is it to sooth by kiadly works and acts, divert the mind by telling stories, or by explaining pictures, or by providing it with new toys. We have many a time in our professional experience as to sick children, found more benefit to be derived from a beautiful or interesting toy, than from a dose of physic. The greatest humanity a mother can exhibit in respect to her sick child is to divert it, *divert it*, DIVERT IT, in all pleasing ways possible, as we ourselves who are larger children, feel sometimes really sick, when a cheerful face and much-loved friend has come in, and before we know it we have forgotten what was the matter with us.—*Hall's Journal of Health.*

MOUNT DIABLO QUICKSILVER MINES.

We understand that some delay has been experienced in getting the machinery upon the ground at the Welch claim, by reason of the road not being completed as soon as expected. The contractors have now been allowed two weeks longer, by the expiration of which time the road will be ready for the passage of teams. Mr. Ogilsby has his machinery all ready, and will lose no time in putting up his crushers and furnaces. We understand that Mr. O. will take his family to the mine and devote his personal attention to forwarding the work, both of putting up the machinery and the subsequent development of the mine. The proprietors have the fullest confidence in the future of the undertaking.

The Camanche company, next adjoining, on the north, have renewed operations upon their portion of the lode with the most flattering prospects of soon being able to reach as good or better ore than can be found upon the Welch company's ground. We are not advised of what the Union company is doing on the south extension; but presume they will not remain long idle after noticing the progress which is being made by the other companies. The situation of this mine cannot be excelled by that of any other mining operation in California; convenient of access from this city, with plenty of timber and water, it is also pleasant in its topographical surroundings, being in full view of Clayton, Pacheco, Pacheco Valley, Benicia, the Government Navy Yard and works at Mare Island, Suisun Bay, with a fine view of the Sierra Nevada mountains in the distance.

IMPORTANT MINING DECISION.

It has been a mooted question whether a stockholder in any of our mining companies could be held *personally* liable for assessments upon his stock. The prevailing view has been that the stock alone of such stockholder was liable; and that the only remedy with the corporation was to sell the stock for assessment, and where the stock was worthless, the corporation must suffer the loss. A case involving this issue was decided on the 9th instant by Judge Underhill, in the County Court of Calaveras county. The case was that of the East Walker River Mining Association *vs.* A. B. Rayuor.

The company was incorporated for the purpose of mining out of the State. By the law of 1861, in reference to such corporations, assessments regularly levied "shall constitute a valid and binding obligation upon the holders of stock to pay the sum so assessed against the stock so held."

The general corporation Act which governs companies organized for mining *in the State*, contains no such provision. The counsel for plaintiff in this case contended for the liability of the defendant—1st, upon the terms of the statute of 1861, making the assessment "a valid and binding obligation to pay," etc.; and 2d, upon the ground that from the relation of stockholder and company created by defendant taking the stock, a promise on the part of defendant to pay the assessments was implied. His Honor sustains the plaintiff upon both grounds, and gives judgment against defendant.

Under the statute of 1861, having reference to corporations formed for mining out of the State, the point seems quite obvious; the dispute seems to be upon the latter ground. This is an important question to the innumerable stockholders of our home corporations.

Judge Underhill bases his opinion on this point upon the case of Hartford and New Haven R. R. Co. *vs.* Kennedy, 12 Conn. R., a very learned decision of the Supreme Court of Connecticut, in which J. Huntington, Justice, seems to have exhausted the subject.

The decision was published in full in the Stockton *Independent* of last week.

ARIZONA.—Just previous to the adjournment of the last Congress, Hon. Charles D. Poston, of Arizona, made a speech full of information concerning the Indian affairs of Arizona, in support of a clause to the miscellaneous appropriation bill for allowing the sum of $150,000 to the friendly Indians of that Territory. We have marked some passages in this speech of special interest for insertion in the columns of the MINING AND SCIENTIFIC PRESS, which we shall endeavor to give at an early day.

THE SONORA-GWIN TALK.

The reports current with regard to the cession of Sonora to France and the creation of a dukedom, in connection therewith, for the exile Gwin is pronounced in intelligent French circles to be utterly absurd and without any foundation whatever. Napoleon has created but four dukes, and those for men only who have accomplished the most signal services for the Emperor. There are hundreds of Frenchmen who have vastly superior claims upon the favor of the Emperor over Gwin, who, in fact, may be considered rather a stumbling block than otherwise in his path. Moreover, the French government organ has stated, in most emphatic terms, that Gwin has no connection whatever with that government. Even the reported mortgage, it is said, can have no foundation in fact, because such an act would be a cause of war to Great Britain and Spain, inasmuch as the joint intervention of Great Britain, France and Spain in Mexico contains the following provision: "The high contracting parties bind themselves not to seek for themselves, in the employment of the coercive measures foreseen by the present Convention, any acquisition of Territory." The fact of the existence of this clause in said treaty has been officially communicated to our government, and was, on the 14th of April, 1862, formerly communicated to the House of Representatives, in a special message by President Lincoln. The fact is, France is now actually, though gradually, withdrawing her troops from Mexico. All the talk about the designs of France in this direction is doubtless made under a state of excited misapprehension with regard to the facts. It is provocative of mischief only, and pernicious in the extreme as tending to excite angry passions and distract capital and business.

The Mexican problem will work out its own solution in due time. Of this fact probably no one is better aware than the astute diplomatist who wears the imperial purple of France. There is no power in our Government to prevent its citizens from emigrating to Mexico or anywhere else; although it may have power, and will probably exercise it in putting a stop to the open and avowed intervention "emigration scheme" now in progress at the East. We know not what may be the policy of the government in allowing the present open enrollment in advertised offices; but it is quite evident that such expeditions cannot be allowed to sail from our ports. Still the emigrants will go forward, quietly, and in small, unpretentious numbers. We shall soon have a large army on the very borders of Mexico under the intrepid Sherman. They will probably have very little fighting to do between Washington and the Rio Grande. When on the banks of that river their mission will be at an end, and they will be mustered out of service, or at least large numbers of them will obtain their discharge there. What then? Maximillian and the Emperor Napoleon both full well know that with the friendly legions of Juarez in their front, and a government powerless to control their individual movements behind, and with the *animus* which now inspires the American people, both in and out of the army, there is no earthly force that can keep them from moving towards the equator. The Imperial twain will see no alternative but to bow to the inexorable decree of destiny, by which the elder of the two has ever professed to be governed. There will be no war, simply because our Government will watch carefully and see that no breach of international law shall be accomplished. France, as we have said, has already *commenced* the withdrawal of her troops, and will not cease the movement until it shall be completed. Maximillian can do nothing but await the events of the future and govern his movements thereby. In the meantime, no stone will be left unturned by the enemies of both and all governments to bring on a rupture between France and the United States. To this end it is that the adventurer Gwin is flitting back and forth between the old world and the new, throwing out ominous hints, as he goes, and perhaps exhibiting forged documents pretending to issue from the Imperial seal, by which he hopes to so excite and exasperate our people as to drive them into acts of overt hostility in spite of an honest and well meaning Executive at Washington. His efforts, however, will meet with as miserable a failure as that which has just plunged his companions in rebeldom in the lowest depths of infamy and disgrace.

THE HIGH PRICE OF PRINTING PAPER.—The high rates of printing paper in the Atlantic States during the past three years, as is well known, has had the effect to kill off a large number of country newspapers. While journals in the East have suffered severely in this respect, those of California, owing to the high premium on gold, felt the rise in paper but moderately until recently, when legal tenders took a sudden rise, and to-day we are obliged to pay higher prices for printing stock than at any time during the war. The following table shows the prices that have raled in the Eastern market:

DATE.	1862. CTS.	1863. CTS.	1864. CTS.
January	9½	15	15
February	9½	15	15
March	9½	15	15
April	9½	15	16
May	9¾	15	16
June	9½	13½	19
July	9½	13	24
August	9½	12½	27
September	9½	12½	28
October	10	12½	27
November	11½	13	26
December	14	14½	25

SKETCHING FROM NATURE.—We would call the attention of our readers to the advertisement of Prof. C. Elveena, who guarantees to teach any person to sketch from nature accurately, in two or three lessons, without the aid of instruments. We take pleasure in saying, that so clearly arranged and so perfect is the system employed by the Professor, that any person, even without taste for the art, will soon become proficient under his tutelage; and even those who think themselves quite perfect, by reason of long practice, will find that they are soon able to overcome obstacles which they vainly sought, through long years of practice, to surmount in this pleasing art. The Professor also gives lessons in mechanical and architectural drawing, shading, and painting in oil and water colors, with the same signal success as that which characterizes his landscape sketches from nature.

HIGHLY COMPLIMENTARY.—The *Pacific*, which, we believe, is the oldest and best patronized religious journal on this coast, appears to have a high appreciation of our humble efforts, as is shown by the following paragraph, which we clip from its issue of the 19th inst.:

THE MINING AND SCIENTIFIC PRESS.—The proprietors of this journal deserve the thanks and patronage of all who desire to be skillful and successful miners. In dimensions it is equalled by only one mining paper now in existence—the London *Mining Journal*—and it is conducted with enterprise and ability. Besides mining intelligence from all quarters, it contains, every week, articles descriptive of new processes, or of improvements in old processes: articles instructive as to the theory and suggestive as to the practice of mining in all its branches. These articles are not "*easy* reading," it must be confessed, and are, probably, not designed to be. But they will repay the study they require. The time is past when men could deserve or rightfully expect success in mining in virtue simply of hard work. There must be *thought*, study, skill. If ore which assays largely pays poorly, the difficulty must be sought out and its remedy applied. It does not become those who lay claim to a Californian energy and a Yankee ingenuity to wait listlessly and lazily for things to come of themselves. And it is simply wasteful to use up ore and capital in operations found on experiment to be ineffectual. The PRESS, of course, does not vouch for the professed improvements which it describes. Men must judge for themselves. But is it probable that these articles could be intelligently read by interested parties for any great length of time without suggesting something of practical value? On the contrary is it not probable that many a claimant of ledges now unwrought and valueless is struggling with poverty and debt for lack of just the knowledge which he might gain by a careful study of such articles as these?

THE building for the next World's Fair, which is to take place in Paris, will hold 200,000 persons, and will cost $3,000,000.

FROM THE OIL REGIONS.

The announcement made a few days since that Government has issued instructions to the Land Office in Humboldt county to withhold petroleum lands from sale, on the ground that they are mining lands, appears to have produced a renewed activity in this new interest. The announcement is construed as nullifying all locations made upon such lands as had not at the date of reservation been actually approved or allowed, or at least such as had not been regularly surveyed by Government authority and offered for sale in the usual manner.

In addition to this, we are informed that Congress has recognized the validity of possessory claims upon mineral lands, which is very properly construed into a recognition by that body of the rules and regulations prescribed and adopted by the miners in their various localities and commonly known as "mining laws."

The application of these laws to the oil lands will probably result in a marked indifference to the rights of those who have based their claims upon selections and applications made upon unsurveyed lands under the homestead and other acts prior to the issuance of the instructions above alluded to. The Humboldt *Times* informs us that such results are already apparent in that county, and that under this new condition of things the rush to the oil regions still continues unabated. The hill tops, the mountain sides, the gulches and the creek beds are now alive with the eager prospector for "indications," and wherever such are found, the supposed fortunate hunter drives his stake, posts his notice, and forthwith hastens to the Recorder's office to make his record. Prospecting is being pushed forward with increased energy.

In the Frazier District, the greater portion of the country lying in the course of the supposed oil belt, has been recently located under the mining laws of the district. The indications in this locality are considered very good. The oil-bearing rock shows itself in great profusion throughout a large portion of the district, and is strongly impregnated with the odor peculiar to kerosene oil, although the oil itself is not seen in it. Gas and oil springs are also found there, and constitute a part of the indications of the existence of oil beneath the surface.

The work of developing the claims already provided with machinery, is progressing favorably, while on others preparations are being made for boring, which will be commenced upon the arrival of the machinery that is now on its way. In fact there seems to be a determination to drive on with the work commenced, to solve the problem as to the existence of the coveted prize here, and to pursue it until a result favorable or unfavorable shall be obtained.

The Garcia Petroleum Oil Company is the name of a new organization formed in this city on the 22d inst., for the purpose of working upon oil lands located over one year ago on the Garcia river, in Mendocino county. The stock has all been taken and an assessment levied for the purpose of developing the ground by boring. The following are the officers elected: Thomas Walter, President; D. S. Cutter, Secretary; W. P. C. Whiting, Max Walter, R. Stevens, G. E. Webber and J. G. Morse, Trustees.

POLISHING PLOWS.—If those who wish to spare themselves the trouble of polishing a rusty mould-board, will have recourse to muriatic acid, they will find that it will not touch the iron, but will render the rust soluble and easily removed. It should not be allowed to remain long on the surface. Muriatic acid will do the work in five minutes, and should be either washed off or cleansed by running through the soil without delay. The use of sulphuric acid for such purposes is very objectionable, as it will eat into the iron and destroy the surface. It will not only dissolve the oxyds, but the metal, very rapidly.

NEW HAY has made its appearance in the San Jose market at $12 per ton.

MINING SHAREHOLDERS' DIRECTORY.

List of Notices of Meetings, Assessments and Delinquent Sales.

Comprising the Names of Companies, District or County of Location, Amount of Assessment; Date of Meeting, Delinquent Advertisement and Sale, and the Place of Business of the Corporation if it is not in San Francisco.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.
